1963 CENSUS OF MANUFACTURES

INDEX OF PRELIMINARY REPORTS, BY REPORT NUMBER AND INDUSTRY CODE

Report Number	Summary Title
MC63(P)-1	Horsepower of Power Equipment Available in Manufacturing Industries
MC63(P)-2	Fuels and Electric Energy Consumed by Manufacturing Industries
MC63(P)-3	General Statistics for Industry Groups and Industries
MC63(P)-4	General Statistics for Geographic Divisions and States
MC63(P)-5	Shipments of Defense-Oriented Industries in 1963 by Industry, Region, and Federal Agency
MC63(P)-6	Water Use in Manufacturing
MC63(P)-7	General Statistics for Counties
MC63(P)-8	General Statistics for Standard Metropolitan Statistical Areas
MC63(P)-9	General Statistics for States

Report Number	SIC Code	Industry
MC(P)-		
20A-1	(2011 (2013	Meat slaughtering plants and Meat processing plants
2	2015	Poultry dressing plants
20B-1	2021	Creamery butter
2	2022	Natural and process cheese
3	2023	Condensed and evaporated milk
4	2024	Ice cream and frozen desserts
5	2026	Fluid milk
20C-1	2031	Canned and cured seafoods
2	2032	Canned specialties
3	2033	Canned fruits and vegetables
4	2034	Dehydrated foods products
5	2035	Pickles, sauces, salad dressings
6	2036	Fresh or frozen packaged fish
7	2037	Frozen fruits and vegetables
MC(P)-		
20D-1	(2041 (2045	Flour mills and Blended and prepared flour
2	2042	Prepared animal feeds
3	2043	Cereal preparations
4	2044	Rice milling
5	2046	Wet corn milling
20E-1	2051	Bread and related products
2	2052	Biscuit, crackers and cookies
20F-1	2061	Raw cane sugar
2	2062	Cane sugar refining
3	2063	Beet sugar
4	(2071 (2072	Confectionery products and Chocolate and cocoa products
5	2073	Chewing gum

1963 Census of Manufactures

Subject Reports

(Preliminary)

November 21, 1963 SERIES: MC63(P)-1

HORSEPOWER OF POWER EQUIPMENT AVAILABLE IN MANUFACTURING INDUSTRIES DECEMBER 31, 1962

The aggregate horsepower of power equipment available in manufacturing industries as of December 31, 1962, amounted to 154 million or 43 percent more than the 1954 revised total of 108 million, according to the U. S. Department of Commerce, Bureau of the Census. The aggregate horsepower per 100 production workers in 1962 was 1,269 compared with 958 for 1954, when the last measurement of power equipment rated one horsepower or more available in manufacturing industries was made.

The aggregate horsepower represents the unduplicated rating of total installed equipment; it is comprised of the horsepower of prime movers plus the horsepower of electric motors driven by purchased electric energy. The horsepower rating for prime movers at the close of 1962 totaled about 46 million compared with the 1954 figure of 36 million. The totals for electric motors driven by purchased electricity were 108 million and 72 million, respectively, as of December 31, 1962, and 1954.

The 1962 statistics on horsepower rating of power equipment, and those for earlier years (table 1), by major industry group (table 2), by selected industry group and industries (table 3), and by divisions and States (table 4), which appear in this publication, are based upon preliminary tabulations of figures collected in a special sample survey MC-D-12, "Supplementary Inquiries for 1962." This survey is a part of the 1963 Census of Manufactures program.

Form MC-D-12 was mailed to approximately 60,000 manufacturing establishments included in the 1962 Annual Survey of Manufactures panel and about 1,000 additional respondents in fourteen selected industries. The industry classification assigned to each annual survey establishment in the MC-D-12 Survey was the same as that used in tabulating the 1962 Annual Survey whereas 1958 industry codes were used for the supplemental fourteen industry panel of respondents. Similarly, other related information such as the sample weight and geographic code are identical for both the annual survey and the D-12 Survey. Related data bearing upon the utilization of power equipment, such as number of production workers, man-hours, and value of shipments appear in the 1962 Annual Survey of Manufactures reports, M62(AS)-1, "General Statistics for Industry Groups and Selected Industries," and M62(AS)-4, "Statistics for States, Standard Metropolitan Statistical Areas, and Large Industrial Counties." Data showing fuels consumed by type and quantities of electric energy purchased and generated were also obtained in the MC-D-12 Survey and will be shown in a forthcoming report, "Fuels and Electric Energy, 1962."

The 1962 categories for reporting horsepower of installed power equipment are similar to those for 1954 except that respondents in 1962 were requested to report figures separately for electric motors rated five horsepower and over and for motors rated one horsepower but less than five. No information was requested for fractional horsepower motors in either year. Data on the rated capacity of electric generators as well as for the other categories include the ratings for idle capacity. The statistics for prime movers not driving generators exclude the horsepower rating of automobiles, trucks, and other highway equipment.

The 1954 statistics shown in this report are based on retabulations of previously published data to reflect the principal revisions

U.S. DEPARTMENT OF COMMERCE, Luther B. Hodges, Secretary

BUREAU OF THE CENSUS, Richard S. Scammon, Director

For sale by Bureau of the Census, Washington, D. C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

in industry classifications stemming from the 1957 edition of the Standard Industrial Classification Manual. The 1954 figures also include data for Hawaii and Alaska but exclude data for all establishments in Industry Group 279, Printing Trade Service Industries, and those in Major Group 23, except Industry 2381, Fabric dress and work gloves. The 1962 totals include reports for all manufacturing establishments classified in Major Group 23, Apparel and Related Products, as well as for Major Group 27, Printing and Publishing.

The 1954 totals are based on a complete enumeration of all establishments except for an unspecified number of small establishments in selected industries, whereas the 1962 figures are reciprocal estimates obtained from the probability sample of approximately 60,000 establishments. While the 1962 estimates vary from the totals which would have been obtained from a complete canvass of approximately 300,000 manufacturing establishments, the relative magnitude of the sampling variation for the totals shown in this release is generally less than three percent.

The 1962 final report on horsepower of power equipment will contain information for additional individual industries as well as for industry groups by geographic divisions and States. The data shown in this publication should be regarded as subject to revision in the final report. The sample design and estimating procedure for this survey will also be described in detail in the final publication.

Table 1.—HORSEPOWER OF POWER EQUIPMENT IN MANUFACTURING INDUSTRIES: 1962 AND EARLIER YEARS

Census year	Aggregate horsepower (prime movers and electric motors driven by purchased energy) (1,000 hp)	Prime movers (1,000 hp)			Electric motors (1,000 hp)			Aggregate horsepower per 100 production workers
		Total	Driving generators	Not driving generators	Total	Driven by purchased energy	Driven by energy generated at establishment	
1962	154,019	45,832	24,121	21,711	129,009	108,187	20,822	1,269
1954[1]	108,100	35,763	21,036	14,727	91,505	72,337	19,168	958

[1]The 1954 figures have been revised to include data for Alaska and Hawaii as well as revised figures for Industry 3851, "Ophthalmic goods."
[2]The data for 1939 include revisions due primarily to differences in scope of the 1939 and 1954 Censuses of Manufactures.
[3]Includes data for hand trades and neighborhood industries.

Table 2.—HORSEPOWER OF POWER EQUIPMENT IN MANUFACTURING INDUSTRIES BY MAJOR INDUSTRY GROUP: 1962 AND 1954

Note: Detailed figures may not add to totals because of independent rounding. NA Not available. r Revised. [1]Figures for 1954 have been revised to reflect the principal revisions in industry classifications stemming from the 1957 Standard Industrial Classification and revised totals for Industry 3851, "Ophthalmic goods." The 1954 "All industries" totals but not for Major Industry Groups, include data for Alaska and Hawaii. The aggregate horsepower for these two States amounted to 232 thousand, of which 190 thousand was reported by establishments classified in Major Group 20. [2]In the Apparel Industries, Major Group 23, horsepower data were collected only for Industries 2381, Fabric and Combination Dress Gloves, and 2382, Fabric and Combination Work Gloves. Consequently totals for the 2-digit group are not available. The industries which were not canvassed would have a negligible effect on the United States totals. In the Printing and Publishing Industries, Major Group 27, horsepower data were not collected for group 279, Printing Trades Service Industries, in 1954. Since these industries would have a negligible effect on the totals for Major Group 27, the Major Group totals are shown. [3]Data for Major Groups 35 and 36 combined. Aggregate horsepower per 100 production workers for Major Groups 35 and 36 combined is 691 for 1962.

Table 3.—HORSEPOWER OF POWER EQUIPMENT IN MANUFACTURING INDUSTRIES BY SELECTED INDUSTRY GROUP AND INDUSTRY: 1962

Code	Industry	Aggregate horsepower (Prime movers and electric motors driven by purchased energy) (1,000 hp)	Prime movers (1,000 hp)			Electric motors (1,000 hp)			Aggregate horsepower per 100 production workers

Note: Detailed figures may not add to totals because of independent rounding.
r Includes revised figures for Industry 3851, "Opthalmic goods."
[1]The 1954 figures exclude data for power equipment for Major Industry Group 23, Apparel and Related Products, and for Group 279, Printing Trade Service Industries.

USCOMM-DC

1963 Census of Manufactures

Subject Reports

(Preliminary)

FOR RELEASE: January 8, 1964 SERIES: MC63(P)-2

FUELS AND ELECTRIC ENERGY CONSUMED BY MANUFACTURING INDUSTRIES

1962

This report contains preliminary estimates of the total cost of fuels by kind, quantity and cost of electric energy purchased, and quantity of electricity generated, used and sold by manufacturing plants. Statistics are shown for prior years (tables 1 and 2), by major industry groups (table 3) and selected industries (table 4), and by divisions and States (table 5). Data showing the quantities of specified fuels produced and consumed in the same establishment appear in the above pertinent tables and by regions and States in table 6. Figures on purchased fuels converted to other fuel forms (e.g., crude petroleum purchased and used to refine petroleum fuels and products) or consumed as raw materials (e.g., fuel oil or natural gas purchased to produce carbon black or converted to other chemical products) appear in table 6. The 1962 statistics on detailed fuels and electric energy contained in this report are based upon preliminary tabulations of figures collected in a special sample survey, MC-D-12, Supplementary Inquiries for 1962. This survey is a part of the 1963 Census of Manufactures program.

Form MC-D-12 was mailed to approximately 60,000 manufacturing establishments included in the 1962 Annual Survey of Manufactures, and about 1,000 additional respondents in 14 selected industries. The industry classification assigned to each establishment for tabulation purposes was the same as that used in tabulating the 1962 survey whereas 1958 industry codes were used for the supplemental 14 industry panel of respondents. Similarly, other related information such as the sample weight and physical location are identical for both the annual survey and the D-12 survey. These identical characteristics of the two surveys permit correlations of the 1962 data appearing in this report with information on number of production workers, man-hours, and value of shipments appearing in the 1962 Annual Survey of Manufactures reports, M62(AS)-1, "General Statistics for Industry Groups and Selected Industries," and M62(AS)-4, "Statistics for States, Standard Metropolitan Statistical Areas, and Large Industrial Counties." Preliminary statistics showing the horsepower rating of power equipment available in manufacturing industries as of December 31, 1962, are shown in the 1963 Census of Manufactures subject report, Series MC63(P)-1 which bears this title.

In the 1962 MC-D-12 survey, all respondents were requested to report figures for a standard detailed fuel inquiry. Provision was made for reporting separate figures for coal, coke, distillate, and residual fuel oil, three specified types of gas, and an "all other fuels category." In the 1958 Census of Manufactures, when the last survey on consumption of specified fuels was conducted, the reporting categories for oil and gas were not detailed and, in addition, the reporting categories varied by industry. Furthermore, detailed fuel data were not requested from establishments classified in the following industries: (1) those which accounted for relatively small amounts of any specified fuels consumed or (2) those where the average consumption per establishment was determined to be relatively insignificant. (See 1958 Census

U.S. DEPARTMENT OF COMMERCE, Luther H. Hodges, Secretary

BUREAU OF THE CENSUS, Richard M. Scammon, Director

of Manufactures Volume I, Summary, pages 6-3 and 6-4 for Scope of Detail Fuel Reporting). The 1958 fuel costs for these latter establishments are shown in the category "Not Specified by Kind." This category, which is not used in the 1962 publication, provides a measure by industry group or by State of the undercoverage in the specified 1958 fuels statistics.

The use of a single standard schedule for reporting consumption of fuels used for heat and power and as a raw material uncovered certain past reporting inconsistencies by respondents. These primarily occurred in plants classified in the primary metal industries (Major Group 33). Such reports were adjusted and the items are shown in this report as fuels consumed so that users of the published totals for those industries for which multiple uses are common may allocate specified fuel types in accordance with their technical use.

The 1958 statistics have been revised so that all of the data contained in this report include information for manufacturing establishments located in Hawaii and Alaska. The 1954 and 1958 total cost of fuels and electricity used for heat and power are based on a complete enumeration of all establishments, whereas the 1959-1962 figures are reciprocal estimates obtained from a probability sample of approximately 61,000 respondents. While the 1962 estimates shown in this publication vary from the totals which would have been obtained from a complete canvass of approximately 300,000 manufacturing establishments, the relative magnitude of the sampling variations for the totals shown in this report is generally less than 10 percent and frequently less than 5 percent.

The 1962 final report on specified fuels and electricity consumed will contain information for more selected industries as well as for industry groupings by geographic division, States, and large standard metropolitan statistical areas. More detailed information on distillate and residual oils and types of gas purchased will also be shown. Data on the amount of purchased electricity which is resold or transferred by manufacturing establishments will also be included. The sample design and sample variations associated with the estimates will also be discussed in more detail in the final publication.

Table 1.--FUELS AND ELECTRIC ENERGY USED IN MANUFACTURING INDUSTRIES: 1962 AND EARLIER YEARS

Kind of fuel and purpose or use	1962			1958			1954[1]

Note: See table 6 for details on fuels used as raw materials.

rRevised to include $4.1 million for establishments located in Hawaii and Alaska.
[1]Revised to include data for heat and power reported by manufacturing establishments located in Alaska and Hawaii.
[2]Includes only quantities made and consumed in the same establishment.
[3]See 1958 Census of Manufactures, Summary Statistics, Volume 1, page 6-4, "Industry Classification Changes" for explanation of 1954-1958 changes in reporting.
[4]Includes 34,713 thousand barrels of residual oil, 41,807 thousand barrels of acid sludge, petroleum coke, etc.,
[5]Includes 43,147 thousand barrels of residual fuels and 17,415 thousand barrels of acid sludge, petroleum coke, etc.
[6]Includes 48,521 thousand barrels of residual fuels and 11,582 thousand barrels of acid sludge, petroleum coke, etc.
[7]Includes natural gas, manufactured gas, still gas, blast furnace gas, and coke oven gas.
[8]Principal fuels are gasoline, liquid petroleum gas, wood, and purchased steam.
[9]The 1958 total includes 33,021 thousand barrels of liquid petroleum gases, valued at $92,466 thousand used as a raw material by establishments classified in Industry 2911, Petroleum Refinery; the 1954 total also includes 26,567 thousand barrels of liquid petroleum gases, valued at $72,551 thousand.

Table 2.--FUELS AND ELECTRIC ENERGY USED FOR HEAT AND POWER: 1962 AND EARLIER YEARS

Year	Total cost of fuels and electric energy ($1,000)	Cost of fuels ($1,000)	Electric energy

NA Not available.
S Withheld because the estimate did not meet publication standards either on the basis of the associated standard error of estimate or on the basis of a consistency review.
[1]Includes distillate and residual oil.
[2]Includes natural, manufactured, and mixed gas.
[3]The principal fuels included in this column are gasoline, liquefied petroleum gas, wood, and purchased steam.
[4]See text for explanation.
[5]In addition, 39,048 thousand tons in 1962 and 36,221 thousand tons in 1958 were consumed by establishments manufacturing and consuming coke at the same location (e.g., combined coke oven, blast furnace and steel mill activity.)

[8]Includes about 164 billion barrels of residual oil with a reported cost of approximately $420 million. The remainder is distillate oil.

[7]In addition, petroleum refiners reported that they produced and consumed 76,520 thousand barrels and 60,562 thousand barrels (revised) in 1962 and 1958, respectively. The composition of the 1962 total in thousand barrels is as follows: 34,713 for fuel oil; 34,279 for petroleum coke, and 7,528 for other fuels (acid, sludge, etc.).

[9]In addition, 5,013,062 million cubic feet were consumed by establishments producing still, blast furnace, and coke oven gases; the comparable 1958 figure is 5,515,488 million cubic feet. The 1962 total is composed of 3,661 billion cubic feet for blast furnace gas; 594 billion cubic feet for coke oven gas; and 758 billion cubic feet for still gas.

[4]Includes $4.1 million reported by establishments located in Alaska and Hawaii. This total includes $2.6 million (731 million barrels) of fuel oil and minor amounts for other specified fuels.

[10]Less than 500 kw.-hrs.

Note: Figures may not add to totals because of independent rounding.

S Withheld because the estimate did not meet publication standards either on the basis of the associated standard error of estimate or on the basis of a consistency review.

[1] Includes about 164 billion barrels of residual oil with a reported cost of approximately $420 million. The remainder is distillate oil.

[2] Includes natural, manufactured, and mixed gas.

[3] The principal fuels included in this column are gasoline, liquefied petroleum gas, wood, and purchased steam.

[4] In addition, 39,048 thousand tons were consumed by establishments manufacturing and consuming coke at the same location (e.g., combined coke oven, blast furnace and steel mill activity.)

[5]In addition, petroleum refiners reported that they produced and consumed 76,520 thousand barrels. The composition of the 1962 total in thousand barrels is as follows: 34,713 for fuel oil; 34,279 for petroleum coke, and 7,528 for other fuels (acid sludge, etc.). (See table 6.)

[6]In addition, 5,013,062 million cubic feet were consumed by establishments producing still, blast furnace, and coke oven gases. The 1962 total is composed of 3,661 billion cubic feet for blast furnace gas; 594 billion cubic feet for coke oven gas; and 758 billion cubic feet for still gas.

[7]In addition, petroleum refineries produced and consumed 34,713 thousand barrels of residual oil, with a reported cost of $71,206 thousand; 34,279 thousand barrels of petroleum coke with a reported cost of $51,680 thousand; and other fuels (acid sludge, etc.) of 7,528 thousand barrels at a cost of $9,719 thousand.

[8]In addition, petroleum refiners produced and consumed 758,068 million cubic feet of still gas with a reported cost of $228,933 thousand.

[9]In addition, 4,254,994 million cubic feet of blast furnace and coke oven gases were produced and consumed by establishments classified in this industry group.

Note: Figures may not add to totals because of independent rounding.

S Withheld because the estimate did not meet publication standards either on the basis of the associated standard error of estimate or on the basis of a consistency review.

[1] Includes distillate and residual oil.

[2] Includes natural, manufactured and mixed gas.

[3] The principal fuels included in this column are gasoline, liquefied petroleum gas, wood, and purchased steam.

[4] See text for explanation.

[5] In addition, 39,048 thousand tons in 1962 and 36,221 thousand tons in 1958 were consumed by establishments manufacturing and consuming coke at the same location (e.g., combined coke oven, blast furnace and steel mill activity). For geographic distribution, see table 6.

[1]Includes about 164 billion barrels of residual oil with a reported cost of approximately $420 million. The remainder is distillate oil.
[2]In addition, petroleum refiners reported that they produced and consumed 76,520 thousand barrels and 60,562 thousand barrels (revised) in 1962 and 1958, respectively. These totals comprize data for fuel oil, petroleum coke, and for other fuels (acid sludge, etc.). For 1962 and 1958 geographic distribution, see table 6.
[3]In addition, 5,013,062 million cubic feet were consumed by establishments producing still, blast furnace, and coke oven gases; the comparable 1958 figure is 5,515,488 million cubic feet. The 1962 total is composed of 3,661 billion cubic feet for blast furnace gas; 594 billion cubic feet for coke oven gas; and 758 billion cubic feet for still gas. For geographic distribution, see table 6.
[4]Includes $4.1 million reported by establishments located in Alaska and Hawaii. This total included $2.6 million (731 million barrels) of fuel oil and minor amounts for other specified fuels.
[10]Less than $100 thousand.

Table 6.--FUELS PRODUCED AND CONSUMED BY GEOGRAPHIC REGIONS AND STATES: 1962 AND 1958

1963 CENSUS OF MANUFACTURES

MC63(P)-3*

SUMMARY SERIES

preliminary report

General Statistics for Industry Groups and Industries

This report consists of a reprint of the general statistics for industries which have been issued in a series of 380 reports. It also includes general statistics for the other 45 industries for which no separate industry reports were released. Totals are shown at the 2- and 3-digit industry group levels.

The data parallel those shown in the earlier preliminary report, "General Statistics for Industry Groups and Industries," (MC63(P)-3), released in November 1964, but represent revised figures based on the more detailed review reflected in the preliminary industry reports.

Final statistics will appear in a series of individual industry reports scheduled to be issued beginning in the fall of 1965. The dollar figures in this report have not been adjusted for changes in price or wage levels between the two census years 1958 and 1963.

The 1963 Census of Manufactures is the 27th such census of the United States since 1809. For 1963, it was conducted jointly with the censuses of business (wholesale, retail, and services) and mineral industries. Separate censuses of manufactures and business were conducted in Puerto Rico. Present legislation (Title 13 of the United States Code) provides for a census of manufactures every 5 years, and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in intercensal years. Accordingly, for the years 1959 through 1962, figures comparable with those shown in this publication are available for industry groups and most individual industries.

INDUSTRY CLASSIFICATION

In the census of manufactures, figures are collected from each manufacturing establishment engaged in the mechanical or chemical transformation of materials into new products. A manufacturing establishment usually consists of a single physical location where such industrial operations are performed; for example, a factory, mill, or plant. Each establishment is classified in a particular industry according to the SIC system on the basis of the value of the principal products it produces. As the general statistics (employment, payroll, cost of materials, value of shipments, etc.) are reported for each establishment as a whole, the aggregates of such figures for an industry reflect not only the primary production activities of the establishments classified in that industry, but also their manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). (See "Value of shipments," below). The extent to which plants classified in an industry "specialize" in making products regarded as primary to that industry will be shown in the preliminary report for each industry and the final report for each major industry group.

The SIC system combines the approximately 430 individual industries into 150 industry groups, which are, in turn, combined into 20 major industry groups. Each individual industry is designated by a 4-digit code, each industry group by a 3-digit code identical with the first three digits of its component industries, and each major industry group by a 2-digit code identical with the first two digits of its component industry groups.

October 1965 *This publication REPLACES supplements MC63(P)-3(Rev), December 1964

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS, A. Ross Eckler, Director

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 25 cents.

This report and all other preliminary reports in the 1963 Census of Manufactures series are based upon the 1957 edition of the Standard Industrial Classification Manual as amended by the "Supplement to the 1957 Edition" published by the Bureau of the Budget in 1963.

ESTABLISHMENTS (PLANTS)

In the census of manufactures, a separate report is obtained for each establishment. Businesses with no employees are excluded from the scope of the census. Of the approximately 310,000 manufacturing establishments covered in the 1963 census, most are operated by single-establishment companies. A single report was obtained from such companies. Firms operating more than one establishment were required to submit a report for each separate location. Also, companies engaged in distinctly different lines of activity at one location submitted separate reports for each activity if the company records permitted such a separation, and if the separate activities were economically significant.

EXPLANATION OF TERMS

All employees, number.—This item includes all production and related workers, force-account construction workers, and all nonproduction personnel of manufacturing establishments. The 1963 figures are an average of reported employment totals for the payroll periods ended nearest the 15th of March, May, August, and November. (For highly seasonal industries, an average employment derived from 12 mid-month pay periods will be included in the final reports for the census.)

Payroll.—This total includes all forms of compensation (salaries, wages, commissions, bonuses, vacation pay, and other remuneration) paid during the year to all employees of the establishment. Payroll is reported before deductions for Social Security, income tax, group insurance, union dues, etc.

Production workers, number.—This number includes all workers (up to the working foreman level) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping (but not delivery), maintenance, repair, janitorial, and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), record keeping, and other services closely associated with these production operations; it excludes supervisory employees above the working foreman level, force-account construction workers, and all other nonproduction personnel of manufacturing establishments.

Production workers, man-hours.—This total includes all "plant man-hours" of production and related workers. It consists of all man-hours worked or paid for in 1963, except hours paid for vacations, holidays, or sick leave, when the employee was not at the plant. The figure includes actual overtime hours, not straight-time equivalent hours.

Production workers, wages.—This item consists of that portion of the payroll (as defined above) paid to production workers of manufacturing establishments.

Value added by manufacture.—This measure is derived for each manufacturing establishment by subtracting the cost of raw materials, parts, components, supplies, fuels, goods purchased for resale, and contract work, from the value of shipments (including resales) and adjusting for the net change in finished goods work-in-process inventory.

Value added avoids the duplication in the value of shipments which results from the use of products of some establishments as materials by others. For most purposes, it is the best value measure available for comparing the relative economic importance of manufacturing among industries and geographic areas.

Value of shipments.—This figure represents net selling value, f.o.b. plant, after discounts and allowances, of all shipments of products from manufacturing establishments of an industry in 1963, plus receipts for miscellaneous activities of such plants; it excludes freight charges and excise taxes. Products transferred to other establishments of the same company (such as other manufacturing plants, separate sales branches, or retail dealers) are valued at the nearest approximation to the economic value—i.e., the value includes, in addition to direct costs of production, a reasonable proportion of "all other costs" (company overhead and profits). It should be noted that, for establishments classified in a given industry, the value of shipments includes not only (a) their value of products "primary" to the industry, but also (b) their value of "secondary" products (which are primary to other industries), and (c) their "miscellaneous receipts" for repair work, sale of scrap, installation of own products, receipts for contract work, etc. Also included in the value of shipments are sales of products bought and resold without further manufacture.

A summation of industry value-of-shipments figures to industry group totals results in large and unknown amounts of duplication, because of the addition of shipments reported by related industries engaged in successive fabrication stages in the production of finished manufactured products.

Capital expenditures, new.—This figure includes, for all manufacturing plants in operation and under construction in 1963: Expenditures for new structures and additions (including major alterations, capitalized repairs, and improvements) to the manufacturing plant, whether on contract or by the plant's own work force; new machinery and new equipment; and capitalized repairs and improvements to existing machinery and equipment. Excluded from the new expenditures total are those expenditures for "used" plant and equipment acquired from others, and expenditures for land.

1963 CENSUS OF MANUFACTURES PUBLICATION PROGRAM

The general statistics for most industries shown by geographic region and State, as well as figures on individual products of the industry, have previously been published in the preliminary industry reports, Series MC63(P)-20A through MC63(P)-39D. More detailed figures for each industry will appear in the final Industry Reports which will be published during late 1965 and early 1966.

Preliminary reports for States, standard metropolitan statistical areas, and counties, have also been published with final State reports scheduled for publication in early 1966. (Order forms which list these reports and their prices maybe obtained from the U.S. Department of Commerce field offices or from the Bureau of the Census,Washington, D.C., 20233.)

Table 1.—GENERAL STATISTICS FOR INDUSTRY

(See text for explanation of column

Table 1.—GENERAL STATISTICS FOR INDUSTRY GROUPS

Ind. code	Industry group and industry	1963						
		Establishments number		All employees		Production workers		
		Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)
398 399 190	Miscellaneous manufactures (including ordnance)[5]—Continued							
1925	Complete guided missiles	31	29	150,364	1,334,629	57,046	116,306	417,298
1929	Ammunition, n.e.c.	44	35	27,701	175,192	21,551	41,924	120,289
1931	Tanks and tank components	26	19	11,425	76,870	7,904	16,479	49,061
1941	Sighting and fire control equipment	13	8	9,249	66,949	5,810	11,085	36,641
1951	Small arms, 30mm and under	52	23	10,001	57,347	7,523	15,097	39,294
1961	Small arms ammunition	31	13	8,909	51,895	7,061	14,083	38,092
1999	Ordnance and accessories, n.e.c.	57	34	24,770	176,737	15,046	30,466	94,725
1911	Guns, howitzers, and mortars							

*The totals for some industries have been withheld to permit additional checking of figures. However, data for these industries are included in all higher summary totals such as industry group totals and the "all industries" total. After further review, statistics for these industries will be published in the final industry reports.

[1]Includes expenditures for plants in operation and for plants under construction but not yet in operation.

[2]The total value of shipments for industry groups (2- and 3-digit) and a few individual industries (4-digit) include extensive duplication arising from shipments between establishments in the same industry classification.

[3]The 1963 and most of the 1958 figures represent data for establishments located in the conterminous United States, Alaska, and Hawaii. However, when the 1958 figures were previously published they did not include data for Alaska and Hawaii since these areas did not achieve statehood until 1959. If the addition of the 1958 figures for Alaska and Hawaii to the previously published figures for an industry resulted in a disclosure, the Alaska and Hawaii data for "all employees, number" and "value added by manufacture" are not included.

The industries and industry groups for which data for Alaska and Hawaii are not included and the combined employment was in excess of 100 are shown below. The industries with lesser amounts are not listed:

Industry	Total employment	Industry	Total employment	Industry	Total employment
2061	2,500-4,999	249	100-249	281	100-249
		2499	100-249		
209	250-499			29	100-249
2099	250-499	2515	100-249	3411	250-499
2335	500-999				
		26	500-999	344	250-499
2421	250-499	2611	250-499	3441	100-249
2431	100-249	2661	100-249	3443	100-249

				251	2,942	Guns, howitzers, and mortars	1911

[4]Data for 1958 for Industries 3662 and 3811 are not comparable with data for 1963. There was inadequate provision for a distinction between individual instruments and systems in the product inquiries for the 1958 census. As a result, some respondents reported the output of systems as instruments for lack of a better classification and were, accordingly, classified in Industry 3811 rather than 3662. See the individual census of manufactures preliminary report for Industries 3662 and 3811 for 1963 for a more detailed explanation.

[5]Includes data for privately owned and/or operated establishments classified in Major Group 19, "Ordnance and Accessories." Government-owned and operated establishments are excluded.

[6]In 1963 and 1958, in addition to the employment and payroll reported for operating manufacturing establishments, manufacturing concerns reported separately for central administrative offices or auxiliary units which serve the manufacturing establishments of a company (e.g., storage warehouses, power plants, research laboratories, garages, repair shops, etc.), rather than the general public. Separate reports were obtained if these units were at different general locations from the establishments served or if they serviced more than one manufacturing establishment.

The figures shown for these units do not represent a separate industry but rather a balancing total for all manufacturing industries.

[7]Establishments in this industry were requested to report value of production instead of value of shipments. Consequently, the formula for computing value added by manufacture was modified to exclude any change in finished products inventories between the beginning and end of the year.

[8]Less than $500 thousand.

[9]The 1963 and 1958 data for Industries 2861 and 2999 are not strictly comparable. The 1958 figures for Industry 2999 include an indeterminable number of establishments that were engaged in the manufacture of wood charcoal briquettes. These establishments are included in Industry 2861 in 1963.

[10]Establishments in this industry were requested to report value of work done instead of value of shipments. Consequently the formula for computing value added by manufacture was not adjusted for any inventory change between the beginning and end of the year.

Table 2.—GENERAL STATISTICS FOR DURABLE AND

(The standard industry groups (SIC) have been rearranged within these categories to

Code	Industry group	1963						
		Establishments, number		All employees		Production workers

1963 CENSUS OF MANUFACTURES

SUMMARY SERIES

preliminary report

General Statistics for Geographic Divisions and States

This report presents preliminary results from the 1963 Census of Manufactures for each geographic division and State. Comparable statistics are shown for employment and value added for 1958. Historical data are shown for the United States and each of the nine geographic divisions.

The figures shown in this report have been subjected only to a preliminary review, and must be regarded as tentative approximations of the final census figures. No adjustments have been made in the dollar figures for changes in price or wage levels between the two census years, 1958 and 1963.

The 1963 Census of Manufactures is the 28th such census of the United States since 1809. For 1963, it was conducted jointly with the censuses of business (wholesale, retail, and services) and mineral industries. Separate censuses of manufactures and business were conducted in Puerto Rico. Present legislation (Title 13 of the United States Code) provides for a census of manufactures every 5 years, and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in intercensal years. Accordingly, for the years 1959 through 1962, figures comparable with those shown in this publication are available for States and divisions.

December 1964

ESTABLISHMENTS (PLANTS)

In the census of manufactures, figures are collected from each manufacturing establishment engaged in the mechanical or chemical transformation of materials into new products. A manufacturing establishment usually consists of a single physical location at which such industrial operations are performed; for example, a factory, mill, or plant. Businesses with no employees are excluded from the scope of the census. Of the approximately 310,000 manufacturing establishments covered in the 1963 census, most are operated by single-establishment companies. A single report was obtained from such companies. Firms operating more than one establishment were required to submit a report for each separate location. Also, companies engaged in distinctly different lines of activity at one location submitted separate reports for each activity if the company records permitted such a separation, and if the separate activities were economically significant.

CENTRAL ADMINISTRATIVE OFFICES AND AUXILIARY UNITS

In the 1954, 1958, and 1963 censuses, respondents were asked to file separate reports for any central administrative offices or auxiliary units which were: (1) at different locations from the establishments served or, (2) at the same location as one of these establishments, but were not operated as an integral part thereof and served two or more establishments. The functions of em-

ployees in central administrative offices include: general company policy determination, planning and management (i.e., company purchasing, accounting, general engineering, direction of company personnel matters, and legal and patent matters). Auxiliaries are storage facilities, garages, repair shops, purchasing offices, sales promotion offices, and research laboratories serving the plants or central management of the company. For 1959-1962 employment and payrolls in central offices and auxiliaries were estimated to be the same as in 1958.

EXPLANATION OF TERMS

All employees, number.--This item includes all production and related workers, force-account construction workers, and all nonproduction personnel of manufacturing establishments. The 1963 figures are an average of reported employment totals for the payroll periods ended nearest the 15th of March, May, August, and November. (For highly seasonal industries, an average employment derived from 12 mid-month pay periods will be included in the final reports for the census.)

Payroll.--This total includes all forms of compensation (salaries, wages, commissions, bonuses, vacation pay, and other remuneration) paid during the year to all employees of the establishment. Payroll is reported before deductions for Social Security, income tax, group insurance, union dues, etc.

Production workers, number.--This number includes all workers (up to the working foreman level) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping (but not delivery), maintenance, repair, janitorial, and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), record keeping, and other services closely associated with these production operations; it excludes supervisory employees above the working foreman level, force-account construction workers, and all other nonproduction personnel of manufacturing establishments.

Production workers, man-hours.--This total includes all "plant man-hours" of production and related workers. It consists of all man-hours worked or paid for in 1963, except hours paid for vacations, holidays, or sick leave, when the employee was not at the plant. The figure includes actual overtime hours, not straight-time equivalent hours.

Production workers, wages.--This item consists of that portion of the payroll (as defined above) paid to production workers of manufacturing establishments.

Value added by manufacture.--This measure is derived for each manufacturing establishment by subtracting the cost of raw materials, parts, components, supplies, fuels, goods purchased for resale, and contract work, from the value of shipments (including resales) and adjusting for the net change in finished goods work-in-process inventory.

Value added avoids the duplication in the value of shipments which results from the use of products of some establishments as materials by others. For most purposes, it is the best value measure available for comparing the relative economic importance of manufacturing among industries and geographic areas.

Capital expenditures, new.--This figure includes, for all manufacturing plants in operation and under construction in 1963: Expenditures for new structures and additions (including major alterations, capitalized repairs, and improvements) to the manufacturing plant, whether on contract or by the plant's own work force; new machinery and new equipment; and capitalized repairs and improvements to existing machinery and equipment. Excluded from the new expenditures total are those expenditures for "used" plant and equipment acquired from others, and expenditures for land.

1963 CENSUS OF MANUFACTURES PUBLICATION PROGRAM

The general statistics for each industry, shown by geographic region and State, as well as figures on individual products of the industry, will appear in the Preliminary Industry Reports, Series MC63(P)-20A through MC63(P)-39D. These industry reports are scheduled for publication during the first half of 1965. More detailed figures for each industry will appear in the final Industry Reports which will be published during the summer of 1965. Preliminary reports for States, standard metropolitan statistical areas, and counties, Series MC63(P)-S1 through MC63(P)-S51, will be released shortly with final State reports scheduled for publication in late 1965 and early 1966. (Order forms which list these reports and their prices may be obtained from the U.S. Department of Commerce Field Offices or from the Bureau of the Census, Washington, D.C. 20233.)

[1]Includes central and administrative office and auxiliary unit data.
[2]The totals at the United States level were derived from separate tabulations based on industry rather than geographic division detail. The sum of of the geographic division detail does not add to the United States totals because of (1) independent rounding, and (2) independent correction of the two separate tabulations mentioned above. The differences do not exceed 1/2 of 1 percent for any of the data columns at the United States level.

Table 4.--GENERAL STATISTICS FOR DIVISIONS AND STATES: 1963 AND 1958

(For explanation of column captions see text)

Division and State	1963								1958	
	Number of plants with 20 or more employees	All plants

[1]Includes central and administrative office and auxiliary unit data.
[2]Includes manufacturers' expenditures for plants in operation and plants under construction but not yet in operation.

1963 CENSUS OF MANUFACTURES

SUMMARY SERIES

preliminary report

Shipments of Defense-Oriented Industries in 1963 by Industry, Region, and Federal Agency

This report presents the preliminary results from the 1963 Census of Manufactures supplemental inquiry on Form MA-175, Report on Shipments to or Receipts for Work Done for Federal Government Agencies and Their Contractors and Suppliers in 1963. Figures are shown for the approximately 30 selected "defense-oriented" industries as well as for geographic areas and States. A report showing greater detail by industry, by area, and by procuring agency will be released in the near future.

As indicated in table 1, the total value of shipments of the industries surveyed totaled $40.3 billion in 1963 of which approximately 63 percent was accounted for by Federal Government purchases. As a percent of the total volume of business, government shipments ranged from 12 percent for machinery industries as a group to a high of 87 percent for aircraft and missiles. Direct and indirect shipments on government account (prime contracts and subcontracts) totaled $15.8 billion for aircraft and missile products, $4.9 billion for communication equipment, $2.3 billion for ship building and ordnance, except missiles, $1.3 billion for instruments, $1.0 billion for electronic components and $0.7 billion for machinery. By State, California was highest with government business in the industries surveyed totaling $7.2 billion followed by New York, Connecticut, Ohio, and New Jersey, in that order.

This supplemental survey to the 1963 Census of Manufactures was conducted to measure the impact of government procurement upon selected industries and upon geographic areas. Similar data for all manufacturing are not available inasmuch as this initial attempt to provide these measures was limited to a selected group of industries identified as largely "defense-oriented." The project was financed by the Department of Defense (DOD), the National Aeronautics and Space Agency (NASA), and the Atomic Energy Commission (AEC).

In this survey, government business consists of products shipped to or work done for federal agencies, their contractors, subcontractors, and suppliers. The activity is usually considered as being of two classes: (1) that done directly for federal agencies on government prime contracts and (2) that done on subcontract for use by other manufacturers in performance on Federal Government contracts.

The survey was designed so that the data reported would be comparable to the basic concepts used in the census of manufactures. Accordingly, the product class description, product class code, and 1963 value of shipments were reported by manufacturers using Item 9 of Form MA-100 as the source. Respondents were asked to allocate their shipments by product class and by prime contract or subcontract, to the various government agencies, for which this work was performed. Special attention was directed toward shipments to DOD, NASA, and AEC.

March 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

Approximately 2,150 establishments accounting for over 95 percent of all shipments of the 30 "defense-oriented" industries submitted reports in the survey.

Of the 2,150 returns received, 1,300 reported shipments to the government of more than $100,000 while approximately 700 establishments reported government shipments of less than $100,000. The respondents were instructed not to complete the entire report if they had no government business or less than $100,000 in government shipments. Tables 1, 2, and 3 contain data for all reports received whereas tables 4 and 5 contain data only for those establishments that had more than $100,000 in shipments to the government.

In interpreting the figures for subcontract work, it should be kept in mind that the 30 defense-oriented industries do not include basic materials and other component industries usually important in subcontracts. It should be noted also that companies having prime contracts usually reported interplant transfers within the company as prime contracts rather than subcontracts. In addition, shipments of materials and components purchased by the government and furnished to contractors supplying finished equipment are also reported as prime contracts.

Table 1.--SHIPMENTS AND RECEIPTS OF DEFENSE-ORIENTED INDUSTRIES BY FEDERAL AGENCY AND OTHER CUSTOMER CATEGORIES

Item	Number or value
Number of employees.....1,000...	2,094
Cost of materials.....Million dollars...	16,365
Value of shipments.....do....	40,315
Establishments reporting government shipments of more than $100,000.....do....	37,210
Prime contract shipments, total.....do....	20,030

Instruments--engineering, laboratory and scientific research, aircraft engine; nuclear radiation detection; optical (including lenses); and photographic equipment and supplies.....	3,431	133	868	2,922	815	447	120	15	111	1,414	509
Miscellaneous industries[3].....	1,165	43	280	1,145	713	175	20	52	11	174	20

[1]Includes establishments reporting less than $100,000 or none in government shipments. These figures are not strictly comparable to the 1963 Census of Manufactures since these data are subject to sampling errors and there also may be some differences in industry classification.

[2]Includes only establishments reporting less than $100,000 or none in government shipments. These establishments were not required to complete the entire report and therefore, there is no breakdown by prime contract and subcontract or by agency.

[3]Reported by nonmanufacturing facilities of the manufacturing companies canvassed.

Table 3.--SHIPMENTS AND RECEIPTS OF DEFENSE-ORIENTED INDUSTRIES BY INDUSTRY AND CUSTOMER CATEGORIES

PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

PRELIMINARY REPORTS

Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories—durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

Area Series

Manufactures (51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3-digit industries, and for most individual counties on an "all manufacturing" basis.

Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

Manufactures

Volume I, Summary Statistics

Volume II, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39

Volume III, Area Statistics

Mineral Industries

Volume I, General Summary and Industry Statistics

Volume II, Area Statistics

1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

1963 CENSUS OF MANUFACTURES

SUMMARY SERIES

preliminary report

Water Use in Manufacturing

This preliminary report on water use in manufacturing is based on information reported in the 1963 Census of Manufactures. In that census about 130,000 of the approximately 310,000 manufacturing establishments were requested to complete standard report forms which contain information on water consumption. To obtain efficiently the data essential to the census in a manner consistent with considerations of cost and reportability by the respondent, it was decided to use standard forms requiring full census detail only for those manufacturing plants above a given size in terms of number of employees. For the numerous smaller establishments typically having less detailed records and representing a very minor portion of water consumption, manufacturing output, and employment, data requirements were limited to a relatively few key items, not including water consumption, on a series of short forms. The size cut-offs for short forms varied according to size composition of the industry so that, while the forms covered a small percentage of the industry's aggregates (employment, etc.), they did represent a much higher proportion of the number of establishments. The cut-off generally ranged from 4 to 10 employees. Since the use of short forms was not as extensive in the 1954 Census of Manufactures, comparability is not possible on an establishment basis between 1954 and 1963.

Statistics showing the number of establishments reporting water consumption in 1963 by source and by quantity of water consumption are shown in table 1 for 4-digit industry, in table 2 by geographic division and State, and in table 3 by water use region. The boundaries of the water use regions are shown in the water use region map on page 12. The areas included in the water use regions have only been slightly changed since 1959. To present data on water use in manufacturing together with related census data on manufacturing activity, the country was divided into 18 water use regions. These regions typically represented combinations of river basins. The definitions of these water use regions were developed in consultation with other Federal agencies having responsibilities for water development or use and with representatives of private industry.

Information on industrial water use was first collected and published by the Bureau of the Census in the 1963 Annual Survey of Manufactures. Since then there have been inquiries on water consumption in manufacturing for the years 1954 and 1959. More detailed information on the use of water by manufacturing establishments will be published in a subsequent report covering the year 1964. The data for the subsequent publication will be derived from a survey (MC-D-13) covering those establishments reporting a consumption of 20 million gallons or more in the 1963 census. The report Form MC-D-13 obtains information on quantity of water

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

intake, intake by kind and source, purpose of water intake, amount recirculated and reused, where discharged, and amount and type of treatment. While the slightly over 10,000 establishments consuming 20 million gallons of water or more comprise about 42 percent of total manufacturing employment, they account for more than 95 percent of the water withdrawn for manufacturing purposes.

DEFINITIONS

Source of water referred to as "utility" covers all publicly or privately owned water systems whose primary purpose is the supplying of water to the general public. "Other than utility" refers to all other sources of water such as company water systems, and joint company water systems, whether their source is surface or ground water. Water intake data is composed of both fresh and brackish water.

1963 CENSUS OF MANUFACTURES PUBLICATION PROGRAM

The general statistics for each industry, shown by geographic region and State, as well as figures on individual products of the industry, will appear in the Preliminary Industry Reports, Series MC63(P)-20A through MC63(P)-39D. These industry reports are being published during the first half of 1965. More detailed figures for each industry will appear in the final industry reports which will be published during the summer and fall of 1965. Preliminary reports for States, containing data for standard metropolitan statistical areas and counties, Series MC63(P)-S1 through MC63(P)-S51, are being released during the first half of 1965 with final State reports scheduled for publication in late 1965 and early 1966. (Order forms which list these reports and their prices may be obtained from the U.S. Department of Commerce field offices or from the Bureau of the Census, Washington, D.C. 20233.)

INDUSTRIAL WATER USE REGIONS

U. S. DEPARTMENT OF COMMERCE BUREAU OF THE CENSUS

Edition of 1965

1963 CENSUS OF MANUFACTURES

SUMMARY SERIES

preliminary report

General Statistics for Counties

This report presents a summary of the 1963 Census of Manufactures preliminary figures for each State, standard metropolitan statistical area, and county. These figures were previously published in table 2 of the separate State reports MC63(P)-S1 to MC63(P)-S51.

The following information is shown for 1963: Number of establishments, total employment, total payroll, production workers, production worker man-hours and wages, value added by manufacturing, and capital expenditures. Comparable figures for total employment and value added are shown for 1958.

Two related summary reports are also available: MC63(P)-9, General Statistics for States showing the same figures for each State with 2-digit and 3-digit industry detail, and MC63(P)-8, General Statistics for Standard Metropolitan Statistical Areas showing 2-digit and 3-digit industry detail for each standard metropolitan statistical area with 40,000 or more employees.

The figures shown in this report have been subjected only to a preliminary review, and must be regarded as tentative approximations of the final census figures. No adjustments have been made in the value figures for changes in price level.

The 1963 Census of Manufactures is the 27th such census of the United States since 1809. For 1963, it was conducted jointly with the censuses of business (wholesale, retail, and services) and mineral industries. Separate censuses of manufactures and business were conducted in Puerto Rico. Present legislation (Title 13 of the United States Code) provides for a census of manufactures every 5 years, and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in intercensal years. Accordingly, for the years 1959 through 1962, figures comparable with those shown in this publication are available for States and divisions.

ESTABLISHMENTS (PLANTS)

In the census of manufactures, figures are collected from each manufacturing establishment engaged in the mechanical or chemical transformation of materials into new products. A manufacturing establishment usually consists of a single physical location at which such industrial operations are performed; for example, a factory, mill, or plant. Businesses with no employees are excluded from the scope of the census. Of the approximately 310,000 manufacturing establishments covered in the 1963 census, most are operated by single-establishment companies. A single report was obtained from such companies. Firms operating more than one establishment were required to submit a report for each separate location. Also, companies engaged in distinctly different lines of activity at one location submitted separate reports for each activity if the company records permitted such a separation, and if the separate activities were economically signficant.

CENTRAL ADMINISTRATIVE OFFICES AND AUXILIARY UNITS

In the 1954, 1958, and 1963 censuses, respondents were asked to file separate reports for any central administrative offices or auxiliary units which were: (1) at different locations from the establishments served or, (2) at the same location as one of these establishments, but were not operated as an integral part thereof and served two or more establishments. The functions of employees in central administrative offices include: general company policy determination, planning and

management (i.e., company purchasing, accounting, general engineering, direction of company personnel matters, and legal and patent matters). Auxiliaries are storage facilities, garages, repair shops, purchasing offices, sales promotion offices, and research laboratories serving the plants or central management of the company. For 1959-1962 employment and payrolls in central offices and auxiliaries were estimated to be the same as in 1958.

EXPLANATION OF TERMS

All employees, number.--This item includes all production and related workers, force-account construction workers, and all nonproduction personnel of manufacturing establishments. The 1963 figures are an average of reported employment totals for the payroll periods ended nearest the 15th of March, May, August, and November. (For highly seasonal industries, an average employment derived from 12 mid-month pay periods will be included in the final reports for the census.)

Payroll.--This total includes all forms of compensation (salaries, wages, commissions, bonuses, vacation pay, and other remuneration) paid during the year to all employees of the establishment. Payroll is reported before deductions for Social Security, income tax, group insurance, union dues, etc.

Production workers, number.--This number includes all workers (up to the working foreman level) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping (but not delivery), maintenance, repair, janitorial, and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), record keeping, and other services closely associated with these production operations; it excludes supervisory employees above the working foreman level, force-account construction workers, and all other nonproduction personnel of manufacturing establishments.

Production workers, man-hours.--This total includes all "plant man-hours" of production and related workers. It consists of all man-hours worked or paid for in 1963, except hours paid for vacations, holidays, or sick leave, when the employee was not at the plant. The figure includes actual overtime hours, not straight-time equivalent hours.

Production workers, wages.--This item consists of that portion of the payroll (as defined above) paid to production workers of manufacturing establishments.

Value added by manufacture.--This measure is derived for each manufacturing establishment by subtracting the cost of raw materials, parts, components, supplies, fuels, goods purchased for resale, and contract work, from the value of shipments (including resales) and adjusting for the net change in finished goods work-in-process inventory.

Value added avoids the duplication in the value of shipments which results from the use of products of some establishments as materials by others. For most purposes, it is the best value measure available for comparing the relative economic importance of manufacturing among industries and geographic areas.

Capital expenditures, new.--This figure includes, for all manufacturing plants in operation and under construction in 1963: Expenditures for new structures and additions (including major alterations, capitalized repairs, and improvements) to the manufacturing plant, whether on contract or by the plant's own work force; new machinery and new equipment; and capitalized repairs and improvements to existing machinery and equipment. Excluded from the new expenditures total are those expenditures for "used" plant and equipment acquired from others, and expenditures for land.

STANDARD METROPOLITAN STATISTICAL AREAS

Standard metropolitan statistical areas are integrated economic and social units with a large volume of daily travel and communication between the central city (having 50,000 or more population) and outlying parts of the area. Each area (except in New England) consists of one or more whole counties. An area may contain not only highly industrialized counties but also adjoining counties which, though primarily residential in character, contribute significantly to the industrial counties' labor force and are socially and economically integrated with the central city. These areas were defined by the Federal Committee on Standard Metropolitan Statistical Areas of the U.S. Bureau of the Budget for general purpose use throughout the Federal Government in presenting economic and social data. In the New England States, similar integration criteria have been applied in defining SMSA's on a city and town basis because towns rather than counties are regarded as the significant unit in this region of the country.

The requirement that each SMSA consists of county units (except in New England) sometimes results in the inclusion in an area of a considerable amount of territory which would not ordinarily be considered "metropolitan," much less "industrial." It is recognized that metropolitan areas could be more accurately defined in terms of smaller area segments such as minor civil divisions, but the usefulness of areas so defined would be limited by the fact that many types of economic and social data are available only on a county basis.

Each SMSA is designated by the name of the principal city of the area. In addition to the name of the principal city, the area title may include one or two additional city names.

1963 CENSUS OF MANUFACTURES PUBLICATION PROGRAM

The general statistics for each industry, shown by geographic region and State, as well as figures on individual products of the industry, have been published in the Preliminary Industry Reports, Series MC63(P)-20A through MC63(P)-39D. Preliminary reports for States, standard metropolitan statistical areas, and counties, Series MC63(P)-S1 through MC63(P)-S51 have also been published. Final industry and State reports are scheduled for publication in late 1965 and early 1966. (Order forms which list these reports and their prices may be obtained from the U.S. Department of Commerce field offices or from the Bureau of the Census, Washington, D.C. 20233.)

(Z)) Less than $500 thousand. [r]Revised.

[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3]Includes expenditures for both plants in operation and for plants under construction but not in operation.

[4]The Anaheim-Santa Ana-Garden Grove Standard Metropolitan Statistical Area is coextensive with Orange County, Calif.

[5]The Bakersfield Standard Metropolitan Statistical Area is coextensive with Kern County, Calif.

[6]The Fresno Standard Metropolitan Statistical Area is coextensive with Fresno County, Calif.

[7]The Los Angeles-Long Beach Standard Metropolitan Statistical Area is coextensive with Los Angeles County, Calif.

[8]The Sacramento Standard Metropolitan Statistical Area consists of Placer, Sacramento, and Yolo Counties, Calif.

[9]The San Bernardino-Riverside-Ontario Standard Metropolitan Statistical Area consists of Riverside and San Bernardino Counties, Calif.

[10]The San Diego Standard Metropolitan Statistical Area is coextensive with San Diego County, Calif.

[11]The San Francisco-Oakland Standard Metropolitan Statistical Area consists of Alameda, Contra Costa, Marin, San Francisco, and San Mateo Counties, Calif.

[12]The San Jose Standard Metropolitan Statistical Area is coextensive with Santa Clara County, Calif.

[13]The Santa Barbara Standard Metropolitan Statistical Area is coextensive with Santa Barbara County, Calif.

[14]The Stockton Standard Metropolitan Statistical Area is coextensive with San Joaquin County, Calif.

[15]The Vallejo-Napa Standard Metropolitan Statistical Area consists of Solano and Napa Counties, Calif.

(D) Withheld to avoid disclosing figures for individual companies. (Z) Less than $500 thousand. [r]Revised.

[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3]Includes expenditures for plants under construction but not in operation.

[4]The Albany Standard Metropolitan Statistical Area is coextensive with Dougherty County, Ga.

[5]The Atlanta Standard Metropolitan Statistical Area consists of Clayton, Cobb, De Kalb, Fulton, and Gwinnett Counties, Ga.

[6]The Augusta Standard Metropolitan Statistical Area consists of Richmond County, Ga., and Aiken County, S.C.

[7]The Chattanooga Standard Metropolitan Statistical Area consists of Hamilton County, Tenn., and Walker County, Ga.

[8]The Columbus Standard Metropolitan Statistical Area consists of Chattahoochee and Muscogee Counties, Ga., and Russell County, Ala.

[9]The Macon Standard Metropolitan Statistical Area consists of Bibb and Houston Counties, Ga.

[10]The Savannah Standard Metropolitan Statistical Area is coextensive with Chatham County, Ga.

[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3]Includes expenditures for both plants in operation and for plants under construction but not in operation.

[4]The Chicago, Ill.-Northwestern Indiana Standard Consolidated Area consists of Chicago, Ill., and Gary-Hammond-East Chicago, Ind., Standard Metropolitan Statistical Areas.

[5]The Champaign-Urbana Standard Metropolitan Statistical Area is coextensive with Champaign County, Ill.

[6]The Chicago Standard Metropolitan Statistical Area consists of Cook, Du Page, Kane, Lake, McHenry, and Will Counties, Ill.

[7]The Davenport-Rock Island-Moline Standard Metropolitan Statistical Area consists of Scott County, Iowa, and Henry and Rock Island Counties, Ill.

[8]The Decatur Standard Metropolitan Statistical Area is coextensive with Macon County, Ill.

[9]The Peoria Standard Metropolitan Statistical Area consists of Peoria, Tazewell, and Woodford Counties, Ill.

[10]The Rockford Standard Metropolitan Statistical Area consists of Boone and Winnebago Counties, Ill.

[11]The St. Louis Standard Metropolitan Statistical Area consists of St. Louis City, Franklin, Jefferson, St. Charles, and St. Louis Counties, Mo., and Madison and St. Clair Counties, Ill.

[12]The Springfield Standard Metropolitan Statistical Area is coextensive with Sangamon County, Ill.

(D) Withheld to avoid disclosing figures for individual companies. (Z) Less than $500 thousand.

[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3]Includes expenditures for plants under construction but not in operation.

[4]The Anderson Standard Metropolitan Statistical Area is coextensive with Madison County, Indiana

[5]The Cincinnati, Ohio-Kentucky-Indiana Standard Metropolitan Statistical Area consists of Clermont, Hamilton, and Warren Counties, Ohio, Boone, Campbell, and Kenton Counties, Ky., and Dearborn County, Ind.

[6]The Evansville, Indiana-Kentucky Standard Metropolitan Statistical Area consists of Vanderburgh and Warwick Counties, Ind. and Henderson County, Ky.

[7]The Fort Wayne, Indiana Standard Metropolitan Statistical Area is coextensive with Allen County, Ind.

[8]The Gary-Hammond-East Chicago, Indiana Standard Metropolitan Statistical Area consists of Lake and Porter Counties, Ind.

[9]The Indianapolis, Indiana Standard Metropolitan Statistical Area consists of Hamilton, Hancock, Hendricks, Johnson, Marion, Morgan, and Shelby Counties, Ind.

[10]The Lousiville, Kentucky-Indiana Standard Metropolitan Statistical Area consists of Jefferson County, Ky., and Clark and Floyd Counties, Ind.

[11]The Muncie, Indiana Standard Metropolitan Statistical Area is coextensive with Delaware County, Ind.

[12]The South Bend, Indiana Standard Metropolitan Statistical Area consists of Marshall and St. Joseph Counties, Indiana.

[13]The Terre Haute, Indiana Standard Metropolitan Statistical Area consists of Clay, Sullivan, Vermillion and Vigo Counties, Ind.

(Z) Less than $500 thousand.

[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3]Includes expenditures for both plants in operation and for plants under construction but not in operation.

[4]The Kansas City Standard Metropolitan Statistical Area consists of Cass, Clay, Jackson and Platte Counties, Mo., and Johnson and Wyandotte Counties, Kansas.

[5]The 1960-1962 value added figures for the Kansas City Standard Metropolitan Statistical Area have been revised as follows:

Year	Value added by manufacture ($1,000)	
	As published	As revised
1962	1,561,961	1,440,858
1961	1,329,874	1,191,133
1960	1,364,538	1,264,538

No revisions to the 1959 and earlier years data are required.

[6]The Topeka Standard Metropolitan Statistical Area is coextensive with Shawnee County, Kansas.

[7]The Wichita Standard Metropolitan Statistical Area consists of Butler and Sedgwick Counties, Kansas.

(Z) Less than $500 thousand.

[1] Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2] Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3] Includes expenditures for both plants in operation and for plants under construction but not in operation.

[4] The Ann Arbor Standard Metropolitan Statistical Area is coextensive with Washtenaw County, Mich.

[5] The Bay City Standard Metropolitan Statistical Area is coextensive with Bay County, Mich.

[6] The Detroit Standard Metropolitan Statistical Area consists of Macomb, Oakland, and Wayne Counties, Mich.

[7] The Flint Standard Metropolitan Statistical Area consists of Genesee and Lapeer Counties, Mich.

[8] The Grand Rapids Standard Metropolitan Statistical Area consists of Kent and Ottawa Counties, Mich.

[9] The Jackson Standard Metropolitan Statistical Area is coextensive with Jackson County, Mich.

[10] The Kalamazoo Standard Metropolitan Statistical Area is coextensive with Kalamazoo County, Mich.

[11] The Lansing Standard Metropolitan Statistical Area consists of Clinton, Eaton, and Ingham Counties, Mich.

[12] The Muskegon-Muskegon Heights Standard Metropolitan Statistical Area is coextensive with Muskegon County, Mich.

[13] The Saginaw Standard Metropolitan Statistical Area is coextensive with Saginaw County, Mich.

[14] The Toledo Standard Metropolitan Statistical Area consists of Lucas and Wood Counties, Ohio, and Monroe County, Mich.

(D) Withheld to avoid disclosing figures for individual companies. (Z) Less than $500 thousand. r Revised.

[1] Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2] Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3] Includes expenditures for both plants in operation and for plants under construction but not in operation.

[4] The Jackson Standard Metropolitan Statistical Area consists of Hinds and Rankin Counties, Mississippi.

(D) Withheld to avoid disclosing figures for individual companies. rRevised.

[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3]Includes expenditures for both plants in operation and for plants under construction but not in operation.

[4]The New York, N.Y.-Northeastern New Jersey Standard Consolidated Area consists of the following Standard Metropolitan Statistical Areas: New York, N.Y.; Newark, N.J., Jersey City, N.J., Paterson-Clifton-Passaic, N.J., and of Middlesex and Somerset Counties, N.J.

[5]The Allentown-Bethlehem-Easton, Pa.-N.J., Standard Metropolitan Statistical Area consists of Lehigh and Northampton Counties, Pa., and Warren County, N.J.

[6]The Atlantic City Standard Metropolitan Statistical Area is coextensive with Atlantic County, N.J.

[7]The Jersey City Standard Metropolitan Statistical Area is coextensive with Hudson County, N.J.

[8]The Newark Standard Metropolitan Statistical Area consists of Essex, Morris, and Union Counties, N.J.

[9]The Paterson-Clifton-Passaic Standard Metropolitan Statistical Area consists of Bergen and Passaic Counties, N.J.

[10]The Philadelphia, Pa.-N.J., Standard Metropolitan Statistical Area consists of Bucks, Chester, Delaware, Montgomery, and Philadelphia Counties, Pa., and Burlington, Camden, and Gloucester Counties, N.J.

[11]The Trenton Standard Metropolitan Statistical Area is coextensive with Mercer County, N.J.

[12]The Wilmington, Del.-N.J.-Md., Standard Metropolitan Statistical Area consists of New Castle County, Del.; Salem County, N.J.; and Cecil County, Md.

(Z) Less than $500 thousand.

[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3]Includes expenditures for both plants in operation and for plants under construction but not in operation.

[4]The Albany-Schenectady-Troy Standard Metropolitan Statistical Area consists of Albany, Rensselaer, Saratoga, and Schenectady Counties, N.Y.

[5]The Binghamton Standard Metropolitan Statistical Area consists of Broome and Tioga Counties, N.Y.; and Susquehanna County, Pa.

[6]The Buffalo Standard Metropolitan Statistical Area consists of Erie and Niagara Counties, N.Y.

[7]The New York Standard Metropolitan Statistical Area consists of New York City-Bronx, Kings, New York, Queens, and Richmond Counties-and Nassau, Rockland, Suffolk, and Westchester Counties, N.Y.

[8]The New York, N.Y.-Northeastern New Jersey Standard Consolidated Area consists of the following Standard Metropolitan Statistical Areas: New York, N.Y.; Newark, N.J., Jersey City, N.J., Paterson-Clifton-Passaic, N.J., and of Middlesex and Somerset Counties, N.J.

[9]The Rochester Standard Metropolitan Statistical Area consists of Livingston, Monroe, Orleans, and Wayne Counties, N.Y.

[10]The Syracuse Standard Metropolitan Statistical Area consists of Madison, Onondaga, and Oswego Counties, N.Y.

[11]The Utica-Rome Standard Metropolitan Statistical Area consists of Herkimer and Oneida Counties, N.Y.

(Z) Less than $500 thousand.

[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3]Includes expenditures for plants under construction but not in operation.

[4]The Akron Standard Metropolitan Statistical Area consists of Portage and Summit Counties, Ohio.

[5]The Canton Standard Metropolitan Statistical Area is coextensive with Stark County, Ohio.

[6]The Cincinnati Standard Metropolitan Statistical Area consists of Clermont, Hamilton, and Warren Counties, Ohio; Boone, Campbell, and Kenton Counties, Kentucky; and Dearborn County, Indiana.

[7]The Cleveland Standard Metropolitan Statistical Area consists of Cuyahoga, Geauga, Lake, and Medina Counties, Ohio.

[8]The Columbus Standard Metropolitan Statistical Area consists of Delaware, Franklin, and Pickaway Counites, Ohio.

[9]The Dayton Standard Metropolitan Statistical Area consists of Greene, Miami, Montgomery, and Preble Counties, Ohio.

[10]The Hamilton-Middletown Standard Metropolitan Statistical Area is coextensive with Butler County, Ohio.

[11]The Huntington-Ashland Standard Metropolitan Statistical Area consists of Cabell and Wayne Counties, W. Va.; Boyd County, Ky.; and Lawrence County, Ohio.

[12]The Lima Standard Metropolitan Statistical Area is coextensive with Allen County, Ohio.

[13]The Lorain-Elyria Standard Metropolitan Statistical Area is coextensive with Lorain County, Ohio.

[14]The Springfield Standard Metropolitan Statistical Area is coextensive with Clark County, Ohio.

[15]The Steubenville-Weirton Standard Metropolitan Statistical Area consists of Jefferson County, Ohio, and Brooke and Hancock Counties, W.Va.

[16]The Toledo Standard Metropolitan Statistical Area consists of Lucas and Wood Counties, Ohio and Monroe County, Mich.

[17]The Wheeling Standard Metropolitan Statistical Area consists of Ohio and Marshall Counties, W.Va., and Belmont County, Ohio.

[18]The Youngstown-Warren Standard Metropolitan Statistical Area consists of Mahoning and Trumbull Counties, Ohio.

(Z) Less than $500 thousand.

[1] Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2] Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3] Includes expenditures for plants under construction but not in operation.

[4] The Augusta Standard Metropolitan Statistical Area consists of Richmond County, Ga., and Aiken County, S.C.

[5] The Charleston Standard Metropolitan Statistical Area consists of Berkeley and Charleston Counties, S.C.

[6] The Columbia Standard Metropolitan Statistical Area consists of Lexington and Richland Counties, S.C.

[7] The Greenville Standard Metropolitan Statistical Area consists of Greenville and Pickens County, S.C.

(Z) Less than $500 thousand.

[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3]Includes expenditures for plants under construction but not in operation.

[4]The Chattanooga Standard Metropolitan Statistical Area consists of Hamilton County, Tenn.; and Walker County, Ga.

[5]The Knoxville Standard Metropolitan Statistical Area consists of Anderson, Blount, and Knox Counties, Tenn.

[6]The Memphis Standard Metropolitan Statistical Area consists of Shelby County, Tenn.; and Crittenden County, Ark.

[7]The Nashville Standard Metropolitan Statistical Area consists of Davidson, Sumner, and Wilson Counties, Tenn.

(*) The definition of this standard metropolitan statistical area has been revised since 1958. Comparable 1958 data based on the new definition for the area were not available in time for inclusion in this preliminary publication.

(D) Withheld to avoid disclosing figures for individual companies. (Z) Less than $500 thousand.

[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3]Includes expenditures for both plants in operation and for plants under construction but not in operation.

[4]The Abilene Standard Metropolitan Statistical Area consists of Jones and Taylor Counties, Tex.

[5]The Amarillo Standard Metropolitan Statistical Area consists of Potter and Randall Counties, Tex.

[6]The Austin Standard Metropolitan Statistical Area is coextensive with Travis County, Tex.

[7]The Beaumont-Port Arthur Standard Metropolitan Area consists of Jefferson and Orange Counties, Tex.

[8]The Brownsville-Harlingen-San Benito Standard Metropolitan Area is coextensive with Cameron County, Tex.

[9]The Corpus Christi Standard Metropolitan Statistical Area is coextensive with Nueces County, Tex.

[10]The Dallas Standard Metropolitan Statistical Area consists of Collin, Dallas, Denton, and Ellis Counties, Tex.

[11]The El Paso Standard Metropolitan Statistical Area is coextensive with El Paso County, Tex.

[12]The Fort Worth Standard Metropolitan Statistical Area consists of Johnson and Tarrant Counties, Tex.

[13] The Galveston-Texas City Standard Metropolitan Area is coextensive with Galveston County, Tex.

[14]The Houston Standard Metropolitan Statistical Area consists of Brazoria, Fort Bend, Harris, Liberty, and Montgomery Counties, Texas.

[15]The Laredo Standard Metropolitan Statistical Area is coextensive with Webb County, Tex.

[16]The Lubbock Standard Metropolitan Statistical Area is coextensive with Lubbock County, Tex.

[17]The Midland Standard Metropolitan Statistical Area is coextensive with Midland County, Tex.

[18]The Odessa Standard Metropolitan Statistical Area is coextensive with Ector County, Tex.

[19]The San Angelo Standard Metropolitan Statistical Area is coextensive with Tom Green County, Tex.

[20]The San Antonio Standard Metropolitan Statistical Area consists of Bexar and Guadalupe Counties, Tex.

[21]The Texarkana Standard Metropolitan Statistical Area consists of Bowie County, Texas and Miller County, Arkansas.

[22]The Tyler Standard Metropolitan Statistical Area is coextensive with Smith County, Tex.

[23]The Waco Standard Metropolitan Statistical Area is coextensive with McLennan County, Tex.

[24]The Wichita Falls Standard Metropolitan Statistical Area consists of Archer and Wichita Counties, Tex.

(Z) Less than $500 thousand.

[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.

[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)

[3]Includes expenditures for plants under construction but not in operation.

[4]The Lynchburg Standard Metropolitan Statistical Area consists of Lynchburg city and Campbell and Amherst Counties, Virginia.

[5]The Newport News-Hampton Standard Metropolitan Statistical Area consists of Newport News and Hampton Cities and York County, Virginia.

[6]The Norfolk-Portsmouth Standard Metropolitan Statistical Area consists of Chesapeake, Norfolk, Portsmouth, and Virginia Beach Cities, Virginia.

[7]The Richmond Standard Metropolitan Statistical Area consists of Richmond city and Chesterfield, Hanover, and Henrico Counties, Virginia.

[8]The Roanoke Standard Metropolitan Statistical Area consists of Roanoke city and Roanoke County, Virginia.

[9]The Washington, D.C., Standard Metropolitan Statistical Area consists of the District of Columbia; Alexandria, Fairfax, and Falls Church cities and Arlington and Fairfax Counties, Virginia; Montgomery and Prince Georges Counties, Maryland.

[10]The 1963 and 1958 data may not be strictly comparable for some counties and cities because of boundary redefinitions between the 2 census years.

(D) Withheld to avoid disclosing figures for individual companies. rRevised.
(Z) Less than $500 thousand.
[1]Some counties were withheld from publication in order to (a) avoid disclosing figures for individual companies or (b) permit further checking of the figures for the smaller counties. Additional detail will appear in the final report for this State.
[2]Includes employment and payroll at central administrative offices and auxiliary units. (For a definition of these units see text.)
[3]Includes expenditures for plants under construction but not in operation.
[4]The Charleston Standard Metropolitan Statistical Area consists of Kanawha County, W. Va.
[5]The Huntington-Ashland Standard Metropolitan Statistical Area consists of Cabell and Wayne Counties, W. Va.; Boyd County, Ky.; and Lawrence County, Ohio.
[6]The Steubenville-Weirton Standard Metropolitan Statistical Area consists of Jefferson County, Ohio; and Brooke and Hancock Counties, W. Va.
[7]The Wheeling Standard Metropolitan Statistical Area consists of Ohio and Marshall Counties, W.Va.; and Belmont County, Ohio.

1963 CENSUS OF MANUFACTURES

MC63(P)-8

SUMMARY SERIES

preliminary report

General Statistics for Standard Metropolitan Statistical Areas

This report presents a summary of the preliminary data for 1963 Census of Manufactures for each Standard Metropolitan Statistical Area with 40,000 employees or more. These figures were previously published in table 4 of the separate State reports MC63(P)-S1 to MC63(P)-S51.

Included are the following 1963 figures for all manufacturing and for each 2-digit and 3-digit Standard Industrial Classification (SIC) Industry: Number of establishments, total employment, total payroll, production workers, production worker wages and man-hours, value added by manufactures, and new capital expenditures. Comparable 1958 figures are shown for total employment and value added.

Two other summary reports are available: MC63(P)-7, General Statistics for Counties showing all manufacturing totals for each State, standard metropolitan statistical area, and county, and MC63(P)-9, General Statistics for States showing 2-digit and 3-digit industry detail for each State.

The figures shown in this report have been subjected only to a preliminary review, and must be regarded as tentative approximations of the final census figures. No adjustments have been made in the value figures for changes in price level.

The 1963 Census of Manufactures is the 27th such census of the United States since 1809. For 1963, it was conducted jointly with the censuses of business (wholesale, retail, and services) and mineral industries. Separate censuses of manufactures and business were conducted in Puerto Rico. Present legislation (Title 13 of the United States Code) provides for a census of manufactures every 5 years, and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in intercensal years. Accordingly, for the years 1959 through 1962, figures comparable with those shown in this publication are available for States and divisions.

ESTABLISHMENTS (PLANTS)

In the census of manufactures, figures are collected from each manufacturing establishment engaged in the mechanical or chemical transformation of materials into new products. A manufacturing establishment usually consists of a single physical location at which such industrial operations are performed; for example, a factory, mill, or plant. Businesses with no employees are excluded from the scope of the census. Of the approximately 310,000 manufacturing establishments covered in the 1963 census, most are operated by single-establishment companies. A single report was obtained from such companies. Firms operating more than one establishment were required to submit a report for each separate location. Also, companies engaged in distinctly different lines of activity at one location submitted separate reports for each activity if the company records permitted such a separation, and if the separate activities were economically signficant.

CENTRAL ADMINISTRATIVE OFFICES AND AUXILIARY UNITS

In the 1954, 1958, and 1963 censuses, respondents were asked to file separate reports for any central administrative offices or auxiliary units which were: (1) at different locations from the establishments served or, (2) at the same location as one of these establishments, but were not operated as an integral part thereof and served two or more establishments. The functions of employees in central administrative offices include: general company policy determination, planning and management (i.e., company purchasing, accounting, general engineering, direction of company personnel

matters, and legal and patent matters). Auxiliaries are storage facilities, garages, repair shops, purchasing offices, sales promotion offices, and research laboratories serving the plants or central management of the company. For 1959-1962 employment and payrolls in central offices and auxiliaries were estimated to be the same as in 1958.

EXPLANATION OF TERMS

All employees, number.--This item includes all production and related workers, force-account construction workers, and all nonproduction personnel of manufacturing establishments. The 1963 figures are an average of reported employment totals for the payroll periods ended nearest the 15th of March, May, August, and November. (For highly seasonal industries, an average employment derived from 12 mid-month pay periods will be included in the final reports for the census.)

Payroll.--This total includes all forms of compensation (salaries, wages, commissions, bonuses, vacation pay, and other remuneration) paid during the year to all employees of the establishment. Payroll is reported before deductions for Social Security, income tax, group insurance, union dues, etc.

Production workers, number.--This number includes all workers (up to the working foreman level) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping (but not delivery), maintenance, repair, janitorial, and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), record keeping, and other services closely associated with these production operations; it excludes supervisory employees above the working foreman level, force-account construction workers, and all other nonproduction personnel of manufacturing establishments.

Production workers, man-hours.--This total includes all "plant man-hours" of production and related workers. It consists of all man-hours worked or paid for in 1963, except hours paid for vacations, holidays, or sick leave, when the employee was not at the plant. The figure includes actual overtime hours, not straight-time equivalent hours.

Production workers, wages.--This item consists of that portion of the payroll (as defined above) paid to production workers of manufacturing establishments.

Value added by manufacture.--This measure is derived for each manufacturing establishment by subtracting the cost of raw materials, parts, components, supplies, fuels, goods purchased for resale, and contract work, from the value of shipments (including resales) and adjusting for the net change in finished goods work-in-process inventory.

Value added avoids the duplication in the value of shipments which results from the use of products of some establishments as materials by others. For most purposes, it is the best value measure available for comparing the relative economic importance of manufacturing among industries and geographic areas.

Capital expenditures, new.--This figure includes, for all manufacturing plants in operation and under construction in 1963: Expenditures for new structures and additions (including major alterations, capitalized repairs, and improvements) to the manufacturing plant, whether on contract or by the plant's own work force; new machinery and new equipment; and capitalized repairs and improvements to existing machinery and equipment. Excluded from the new expenditures total are those expenditures for "used" plant and equipment acquired from others, and expenditures for land.

STANDARD METROPOLITAN STATISTICAL AREAS

Standard metropolitan statistical areas are integrated economic and social units with a large volume of daily travel and communication between the central city (having 50,000 or more population) and outlying parts of the area. Each area (except in New England) consists of one or more whole counties. An area may contain not only highly industrialized counties but also adjoining counties which, though primarily residential in character, contribute significantly to the industrial counties' labor force and are socially and economically integrated with the central city. These areas were defined by the Federal Committee on Standard Metropolitan Statistical Areas of the U.S. Bureau of the Budget for general purpose use throughout the Federal Government in presenting economic and social data. In the New England States, similar integration criteria have been applied in defining SMSA's on a city and town basis because towns rather than counties are regarded as the significant unit in this region of the country.

The requirement that each SMSA consists of county units (except in New England) sometimes results in the inclusion in an area of a considerable amount of territory which would not ordinarily be considered "metropolitan," much less "industrial." It is recognized that metropolitan areas could be more accurately defined in terms of smaller area segments such as minor civil divisions, but the usefulness of areas so defined would be limited by the fact that many types of economic and social data are available only on a county basis.

Each SMSA is designated by the name of the principal city of the area. In addition to the name of the principal city, the area title may include one or two additional city names.

1963 CENSUS OF MANUFACTURES PUBLICATION PROGRAM

The general statistics for each industry, shown by geographic region and State, as well as

figures on individual products of the industry, have been published in the Preliminary Industry Reports, Series MC63(P)-20A through MC63(P)-39D. Preliminary reports for States, standard metropolitan statistical areas, and counties, Series MC63(P)-S1 through MC63(P)-S51 have also been published. Final industry and State reports are scheduled for publication in late 1965 and early 1966. (Order forms which list these reports and their prices may be obtained from the U.S. Department of Commerce field offices or from the Bureau of the Census, Washington, D.C. 20233.)

- Represents zero. n.e.c. Not elsewhere classified. (D) Withheld to avoid disclosing figures for individual companies. (Z) Less than $500 thousand. [7]Revised.

[1]Includes expenditures for both plants in operation and for plants under construction but not in operation.

[2]The "All industries, total" includes figures for industry groups which have been withheld from publication in order to (a) avoid disclosing figures for individual companies in this or associated industries or areas or, (b) permit further checking of figures for smaller industry groups. Additional detail will appear in the final report for the State.

[3]Includes data for privately owned and/or operated establishments in Major Group 19, "Ordnance and Accessories." Government owned and operated establishments are excluded.

[4]In addition to the employment and payroll reported for operating manufacturing establishments, manufacturing concerns ordinarily reported separately for central administrative offices or auxiliary units which service the manufacturing establishments of a company (e.g., research laboratories, storage warehouses, power plants, garages, repair shops, etc.). A separate report was usually obtained for each central office or auxiliary unit if it was located at a different general location from the manufacturing establishment(s) served or if it serviced two or more manufacturing establishments and was not operated as an integral part of the establishment at the same location. Employment and payroll of central administrative offices and auxiliaries are included in the totals for the area.

[5]The definition of this standard metropolitan statistical area has been revised since 1958. Comparable 1958 data based on the new definition for the area were not available in time for inclusion in this preliminary publication.

[6]The 1960-1962 value added figures for the Kansas City Mo.-Kans. SMSA have been revised as follows:

Industry	Value added by manufacture ($1,000)					
	As published			As revised		
	1962	1961	1960	1962	1961	1960
All industries, total	1,561,961	1,329,874	1,364,538	1,440,858	1,191,133	1,264,538
37	479,974	337,336	426,897	358,871	198,595	326,897

[7]Data for 1958 for Industries 3662 and 3811 not directly comparable with data for 1963. See 1963 Census of Manufactures preliminary reports for Industries 3662 and 3811 for a more detailed explanation. Totals for Group 36, Electrical Machinery, and Group 38, Instruments and Related Products, amounted to 29,092 employees and $234,124 thousand dollars value added in 1958.

for the data you depend on . . .

STATISTICAL ABSTRACT of the UNITED STATES, 1965

Keeping current and conversant with America's dynamic economic, political, and social tempo is crucial, whether you're in business, education, research or in any one of a host of other jobs where you need figures that fit the facts.

The 1965 edition of the Abstract, published by the Bureau of the Census, is as authoritative, comprehensive, and timely, as the assembled research from 200 government, private, and international agencies can make it.

Organized by subject into 33 major sections, each with introductory text, the 1,299 tables and 50 charts in the 1965 edition are significant records of American activity and achievement. The detailed alphabetical index helps find the facts at hand and the extensive Guide to Sources tells where to find more.

UMMARY SERIES

preliminary report

General Statistics for States

This report presents a summary of the preliminary data for 1963 Census of Manufactures for each State, by industry. These figures were previously published in table 3 of the separate State reports MC63(P)-S1 to MC63(P)-S51.

Included are the following 1963 figures for all manufacturing and for each 2-digit and 3-digit Standard Industrial Classification (SIC) Industry: Number of establishments, total employment, total payroll, production workers, production worker wages and man-hours, value added by manufactures, and new capital expenditures. Comparable 1958 figures are shown for total employment and value added.

Two other summary reports are available: MC63(P)-7, General Statistics for Counties showing all manufacturing totals for each State, standard metropolitan statistical area, and county, and MC63(P)-8, General Statistics for Standard Metropolitan Statistical Areas showing 2-digit and 3-digit industry detail for each standard metropolitan statistical area with 40,000 employees or more.

The figures shown in this report have been subjected only to a preliminary review, and must be regarded as tentative approximations of the final census figures. No adjustments have been made in the value figures for changes in price level.

The 1963 Census of Manufactures is the 27th such census of the United States since 1809. For 1963, it was conducted jointly with the censuses of business (wholesale, retail, and services) and mineral industries. Separate censuses of manufactures and business were conducted in Puerto Rico. Present legislation (Title 13 of the United States Code) provides for a census of manufactures every 5 years, and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in intercensal years. Accordingly, for the years 1959 through 1962, figures comparable with those shown in this publication are available for States and divisions.

ESTABLISHMENTS (PLANTS)

In the census of manufactures, figures are collected from each manufacturing establishment engaged in the mechanical or chemical transformation of materials into new products. A manufacturing establishment usually consists of a single physical location at which such industrial operations are performed; for example, a factory, mill, or plant. Businesses with no employees are excluded from the scope of the census. Of the approximately 310,000 manufacturing establishments covered in the 1963 census, most are operated by single-establishment companies. A single report was obtained from such companies. Firms operating more than one establishment were required to submit a report for each separate location. Also, companies engaged in distinctly different lines of activity at one location submitted separate reports for each activity if the company records permitted such a separation, and if the separate activities were economically signficant.

CENTRAL ADMINISTRATIVE OFFICES AND AUXILIARY UNITS

In the 1954, 1958, and 1963 censuses, respondents were asked to file separate reports for any central administrative offices or auxiliary units which were: (1) at different locations from the establishments served or, (2) at the same location as one of these establishments, but were not operated as an integral part thereof and served two or more establishments. The functions of employees in central administrative offices include: general company policy determination, planning and

management (i.e., company purchasing, accounting, general engineering, direction of company personnel matters, and legal and patent matters). Auxiliaries are storage facilities, garages, repair shops, purchasing offices, sales promotion offices, and research laboratories serving the plants or central management of the company. For 1959-1962 employment and payrolls in central offices and auxiliaries were estimated to be the same as in 1958.

EXPLANATION OF TERMS

All employees, number.--This item includes all production and related workers, force-account construction workers, and all nonproduction personnel of manufacturing establishments. The 1963 figures are an average of reported employment totals for the payroll periods ended nearest the 15th of March, May, August, and November. (For highly seasonal industries, an average employment derived from 12 mid-month pay periods will be included in the final reports for the census.)

Payroll.--This total includes all forms of compensation (salaries, wages, commissions, bonuses, vacation pay, and other remuneration) paid during the year to all employees of the establishment. Payroll is reported before deductions for Social Security, income tax, group insurance, union dues, etc.

Production workers, number.--This number includes all workers (up to the working foreman level) engaged in fabricating, processing, assembling, inspection, receiving, storage, handling, packing, warehousing, shipping (but not delivery), maintenance, repair, janitorial, and watchman services, product development, auxiliary production for plant's own use (e.g., power plant), record keeping, and other services closely associated with these production operations; it excludes supervisory employees above the working foreman level, force-account construction workers, and all other nonproduction personnel of manufacturing establishments.

Production workers, man-hours.--This total includes all "plant man-hours" of production and related workers. It consists of all man-hours worked or paid for in 1963, except hours paid for vacations, holidays, or sick leave, when the employee was not at the plant. The figure includes actual overtime hours, not straight-time equivalent hours.

Production workers, wages.--This item consists of that portion of the payroll (as defined above) paid to production workers of manufacturing establishments.

Value added by manufacture.--This measure is derived for each manufacturing establishment by subtracting the cost of raw materials, parts, components, supplies, fuels, goods purchased for resale, and contract work, from the value of shipments (including resales) and adjusting for the net change in finished goods work-in-process inventory.

Value added avoids the duplication in the valuee of shipments which results from the use of productss of some establishments as materials by others. For most purposes, it is the best value measure available for comparing the relative economic importance of manufacturing among industries and geographic areas.

Capital expenditures, new.--This figure includes, for all manufacturing plants in operation and under construction in 1963: Expenditures for new structures and additions (including major alterations, capitalized repairs, and improvements) to the manufacturing plant, whether on contract or by the plant's own work force; new machinery and new equipment; and capitalized repairs and improvements to existing machinery and equipment. Excluded from the new expenditures total are those expenditures for "used" plant and equipment acquired from others, and expenditures for land.

STANDARD METROPOLITAN STATISTICAL AREAS

Standard metropolitan statistical areas are integrated economic and social units with a large volume of daily travel and communication between the central city (having 50,000 or more population) and outlying parts of the area. Each area (except in New England) consists of one or more whole counties. An area may contain not only highly industrialized counties but also adjoining counties which, though primarily residential in character, contribute significantly to the industrial counties' labor force and are socially and economically integrated with the central city. These areas were defined by the Federal Committee on Standard Metropolitan Statistical Areas of the U.S. Bureau of the Budget for general purpose use throughout the Federal Government in presenting economic and social data. In the New England States, similar integration criteria have been applied in defining SMSA's on a city and town basis because towns rather than counties are regarded as the significant unit in this region of the country.

The requirement that each SMSA consists of county units (except in New England) sometimes results in the inclusion in an area of a considerable amount of territory which would not ordinarily be considered "metropolitan," much less "industrial." It is recognized that metropolitan areas could be more accurately defined in terms of smaller area segments such as minor civil divisions, but the usefulness of areas so defined would be limited by the fact that many types of economic and social data are available only on a county basis.

Each SMSA is designated by the name of the principal city of the area. In addition to the name of the principal city, the area title may include one or two additional city names.

1963 CENSUS OF MANUFACTURES PUBLICATION PROGRAM

The general statistics for each industry, shown by geographic region and State, as well as

figures on individual products of the industry, have been published in the Preliminary Industry Reports, Series MC63(P)-20A through MC63(P)-39D. Preliminary reports for States, standard metropolitan statistical areas, and counties, Series MC63(P)-S1 through MC63(P)-S51 have also been published. Final industry and State reports are scheduled for publication in late 1965 and early 1966. (Order forms which list these reports and their prices may be obtained from the U.S. Department of Commerce field offices or from the Bureau of the Census, Washington, D.C. 20233.)

GENERAL STATISTICS FOR THE STATE, BY SELECTED INDUSTRY GROUPS: 1963 AND 1958

(See text for explanation of column captions)

- Represents zero. n.e.c. Not elsewhere classified. (D) Withheld to avoid disclosing figures for individual companies. (Z) Less than $500 thousand. r Revised.

[1] Includes expenditures for both plants in operation and for plants under construction but not in operation.

[2] The "All industries, total" includes figures for industry groups which have been withheld from publication in order to (a) avoid disclosing figures for individual companies in this or associated industries or areas or, (b) permit further checking of figures for smaller industry groups. Additional detail will appear in the final report for the State.

[3] Includes data for privately owned and/or operated establishments in Major Group 19, "Ordnance and Accessories." Government owned and operated establishments are excluded.

Footnotes continued on next page.

Footnotes—Continued

[4]In addition to the employment and payroll reported for operating manufacturing establishments, manufacturing concerns ordinarily reported separately for central administrative offices or auxiliary units which service the manufacturing establishments of a company (e.g., research laboratories, storage warehouses, power plants, garages, repair shops, etc.). A separate report was usually obtained for each central office or auxiliary unit if it was located at a different general location from the manufacturing establishment(s) served or if it serviced two or more manufacturing establishments and was not operated as an integral part of the establishment at the same location. Employment and payroll of central administrative offices and auxiliaries are included in the totals for the area.

[5]Not directly comparable due to the reclassification of Hardboard Products from Industry 2661 to 2499 in 1963. The combined totals for Group 24, Lumber and Wood Products, and Group 26, Paper and Allied Products, amounted to 27,724 employees and $147,772 thousand value added by manufacture in 1958.

[6]The 1960–1962 value added figures for the State of Missouri have been revised as follows:

Industry	Value added by manufacture ($1,000)					
	As published			As revised		
	1962	1961	1960	1962	1961	1960
All industries, total.....	4,153,853	3,783,580	3,872,287	4,032,750	3,644,839	3,772,287
37.....	1,032,104	814,653	898,383	911,001	675,912	798,383
371.....	738,964	551,212	648,101	617,861	412,471	548,101

No revisions to the 1959 and earlier years data are required.

[7]Data for 1958 for Industries 3662 and 3811 not directly comparable with data for 1963. See 1963 Census of Manufactures preliminary reports for Industries 3662 and 3811 for more detailed explanation. Totals for Group 36, Electrical Machinery, and Group 38, Instruments and Related Products, amounted to 134,581 employees and $1,125,850 thousand dollars value added in 1958.

1963 CENSUS OF MANUFACTURES

INDUSTRY SERIES

preliminary report

Meat slaughtering plants and Meat processing plants

SIC Codes 2011 and 2013

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in Meat Slaughtering Plants shipped products valued at $12,466 million, an increase of 4 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 10 percent from 1958 and 3 percent from 1962 to a total of 181 thousand employees in 1963. Value added by manufacture amounted to $1,824 million in 1963, an increase of 5 percent from 1958 and a decrease of 8 percent from 1962.

During 1963, manufacturers in Meat Processing Plants shipped products valued at $2,101 million, an increase of 2 percent over 1958. Average employment in this industry showed a decrease of 1 percent from 1958 and an increase of 3 percent from 1962 to a total of 48 thousand employees in 1963. Value added by manufacture amounted to $544 million in 1963, an increase of 23 percent from 1958 and 10 percent from 1962.

Meat Slaughtering Plants include establishments engaged primarily in the slaughtering (for their own account, or on a contract basis) of cattle, hogs, sheep, lambs, calves, and other animals, except for small game, for meat to be sold fresh or to be used on the same premises in canning or curing, and for making sausage, lard, and other products.

Table 1A.--GENERAL STATISTICS FOR MEAT SLAUGHTERING PLANTS IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2011)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]	Standard error of estimate (percent) for number of employees column[2]

(NA) Not available. (X) Not applicable. rRevised.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

June 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

Meat Processing Plants include establishments engaged primarily in manufacturing sausages, prepared meats, and meat specialties, but not slaughtering livestock. Included in this industry are sausage or meat kitchens operated by packing houses as separate establishments and establishments engaged primarily in the manufacture of sausage casings.

Industries 2011 and 2013 are similar in many respects and for some purposes should be viewed as one industry. Prepared meats (smoked meats, sausages, canned meats, etc.) are produced by each industry; fresh meats, especially primal cuts and variety meats, are shipped by each. The distinguishing characteristic of Industry 2011 is the slaughtering of livestock, and of Industry 2013 the use of purchased meat material. Nearly all of the fresh meat used as a raw material by plants in Industry 2013 is supplied by plants in Industry 2011; in addition, a considerable volume of fresh meat material is sold or transferred between plants in Industry 2011 for use in further processing.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified as Meat Slaughtering Plants consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified as Meat Slaughtering Plants amounted to $12,466 million. Of this total, $385 million were products primary to other industries; and $512 million were receipts for miscellaneous activities. The industry shipments of primary products represent 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 98 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $13,309 million of meat slaughtering plant products and meat processing plant products were shipped by all producers of these products. Of this total, $11,570 million, or 87 percent, were shipped by plants classified in Industry 2011,

Meat Slaughtering Plants, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 88 percent.

The total value of shipments and other receipts of establishments classified as Meat Processing Plants amounted to $2,102 million. Of this total, $128 million were products primary to other industries; and $307 million were receipts for miscellaneous activities. The industry shipments of primary products represent 93 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 97 percent.

Table 3 indicates that $4,427 million of meat processing plant products, including lard, were shipped by all producers of these products. Of this total, $1,666 million, or 38 percent, were shipped by plants classified in Industry 2013, Meat Processing Plants, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 33 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1A, 1B, and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1A, 1B, and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 1B.—GENERAL STATISTICS FOR MEAT PROCESSING PLANTS IN THE UNITED STATES FOR SELECTED YEARS

(NA) Not available. (X) Not applicable.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the annual survey of manufactures volumes for further discussion of the sampling estimate.

[3]Prior to 1958, plants primarily making sausage casings were classified in Industry 2014, Sausage Casings, but were combined with Industry 2013 for publication. A revision in the Standard Industrial Classification transferred plants primarily making synthetic sausage casings to Industry 3079, Plastics Products, N.E.C. As a result of this change, plants having between 3,000 and 4,000 employees were shifted from Industry 2013, Meat Processing Plants, to Industry 3079, Plastics Products, N.E.C., thus data since 1958 are not completely comparable with data prior to 1958.

[4]Data for Alaska and Hawaii are not included.

[5]Prior to 1954, separate manufacturers' reports were submitted covering the manufacturing of prepared meats at manufacturers' wholesale sales branches which were classified as manufacturing establishments in Industry 2013, Meat Processing Plants. For 1954 and subsequent years, these establishments have been classified in wholesale trade industries. In 1954, however, supplementary reports were submitted for manufacturers' wholesale sales branches on the number of production workers engaged in manufacturing prepared meats, cost of materials consumed in the manufacture of prepared meats, and shipments of prepared meats manufactured on the premises. In 1958, supplementary reports were also submitted, but the information was confined to the shipments of prepared meats manufactured on the premises.

[6]Unadjusted value added.

Table 2.—GENERAL STATISTICS FOR MEAT SLAUGHTERING PLANTS AND MEAT PROCESSING PLANTS BY GEOGRAPHIC AREAS: 1963 AND 1958

(SIC codes 2011 and 2013)

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in these or associated industries or areas, or (b) because these industries were of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on these industries.)

[1]Less than $500 thousand.

Table 3.—QUANTITY AND VALUE OF FRESH AND FROZEN MEATS, SAUSAGE, AND OTHER PREPARED MEATS SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958

(Includes quantity and value of these products reported not only by establishments classified as Meat Slaughtering Plants and Meat Processing Plants but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

Product code	Product	Unit of measure	Total shipments including interplant transfers			
			1963		1958	
			Quantity	Value ($1,000)	Quantity	Value ($1,000)
2011- --	Meat slaughtering plant products, total[1]	.....	(X)	[2]9,099,747	(X)	[2]8,665,440

r Revised.

[1] Substantial quantities of these products are produced at nonmanufacturing establishments and are not included in these data.

[2] Excludes prepared meats made in slaughtering plants.

[3] Quantity estimated based on quantity-value relationship reported for other products.

[4] In the Census Current Industrial Reports Series M20K, "Fats and Oils", data are published for the production of various fats and oils. The production of lard as shown in this report amounted to 2,373.0 million pounds in 1963 and 2,253.0 million pounds in 1958. These data are compiled by the U.S. Department of Agriculture. The production of edible tallow shown in the M20K report was 496.4 million pounds for 1963 and 315.8 million pounds for 1958.

[5] Data represent the output of establishments classified in Industries 2011 and 2013. Detailed information was not obtained from establishments engaged primarily in wool pulling and classified in Industry 3999, Miscellaneous Products, N.E.C.

[6] Includes prepared meats made in slaughtering plants.

[7] Canned meat products containing less than 20% meat are included in the report for Industry 2032, Canned Specialties.

1963 CENSUS OF MANUFACTURES

MC63(P)-20A.2

INDUSTRY SERIES

preliminary report

Poultry dressing plants SIC Code 2015

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in Poultry Dressing Plants shipped products valued at $2,240 million, an increase of 19 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 12 percent from 1958 and 5 percent from 1962 to a total of 70.1 thousand employees in 1963. Value added by manufacture amounted to $413 million in 1963, an increase of 33 percent from 1958 and 10 percent from 1962.

The Poultry Dressing Plants include establishments engaged primarily in the killing, dressing, and packing of poultry, rabbits, and other small game; canning poultry and processing liquid, dried, and frozen eggs. Statistics for poultry and small game killed and dressed at farms, hatcheries, frozen food lockers, and wholesale and retail establishments are not included in this report. Data for liquid and frozen eggs processed at wholesale establishments are also excluded from this report.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957

(NA) Not available. (X) Not applicable.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the annual survey of manufactures volumes for further discussion of the sampling estimate.

[3]The data for 1958 (old) and earlier years were based on the old Standard Industrial Classification definition of Industry 2015, which covered only poultry dressing plants. Under the revised edition of the SIC Manual in use since 1958, Industry 2015 includes not only poultry dressing plants, but also plants primarily engaged in canning poultry (formerly in Industry 2033, Canned Fruits and Vegetables) and plants primarily producing liquid, frozen and dried eggs (formerly in Industry 2099, Other Food Preparations).

[4]Data for Alaska and Hawaii are not included.

March 1965

edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified as Poultry Dressing Plants consist not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified as Poultry Dressing Plants amounted to $2,240 million. Of this total, $33 million were products primary to other industries; and $150 million were receipts for miscellaneous activities. The industry shipments of primary products represented 98 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 98 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $2,102 million of dressed, packed, or canned poultry and processed eggs were shipped by all manufacturing plants producing these products. Of this total, $2,057 million, or 98 percent, were shipped by plants classified in Industry 2015, Poultry Dressing Plants, while the remainder was shipped by plants classified in other manufacturing industries. The value of these products does not include the sales of poultry dressed on farms or by retailers and wholesalers. The comparable ratio for 1958 was 98 percent.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into

account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(X) Not applicable.

[1]Substantial amounts of fowl and small game are killed and dressed for the commercial market on farms, retail and wholesale establishments and are not included in these statistics.

[2]Quantity estimated or partially estimated based on quantity-value relationship reported for other products in the same product class.

[3]Packaged poultry (boned and frozen), not canned, was not requested as a separate item on the report form. It is possible that some companies included their shipments of this product with other products of the industry. Therefore, the figure shown for 1963 represents a minimum measure of the shipments in that year. Comparable data for 1958 are not available.

[4]Substantial amounts of frozen or liquid eggs are processed at wholesale establishments and are not included in these statistics.

Table 3B.—INDEXES OF PRODUCTION AND UNIT VALUE FOR DRESSED, PACKED, OR CANNED POULTRY AND PROCESSED EGGS SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958

1963 CENSUS OF MANUFACTURES

MC63(P)-208.1

INDUSTRY SERIES

preliminary report

Creamery butter SIC Code 2021

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Creamery Butter Industry shipped products valued at $985 million, a decrease of 4 percent from 1958, according to preliminary results obtained from the 1963 Census. Average employment in this industry showed a decrease of 31 percent from 1958 to a total of 12 thousand employees in 1963. Value added by manufacture amounted to $131 million in 1963, a decrease of 11 percent from 1958.

The Creamery Butter Industry includes establishments engaged primarily in the manufacture of creamery butter and anhydrous butterfat.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.—GENERAL STATISTICS FOR THE CREAMERY BUTTER INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2021)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new [1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	766	178	11,962	52,696	8,617	19,409	36,606	130,913	854,001	984,621	10,233
1958	1,058	228	17,295	62,895	12,294	25,561	42,314	147,207	875,257	1,023,460	15,309
1954[3]	1,262	248	21,019	65,601	15,060	32,756	42,920	142,399	867,155	1,013,797	13,566
1947[3 4]	1,904	(NA)	27,109	59,013	19,746	(NA)	41,323	138,217	867,673	1,005,890	(NA)

(NA) Not available.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2] In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3] Data for Alaska and Hawaii are not included.

[4] Data prior to 1947 are not comparable to the information shown for subsequent years. However, in the 1947 Census of Manufactures report, there is shown information for the census years 1904-1947 on a comparable basis.

March 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Creamery Butter Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Creamery Butter Industry amounted to $985 million. Of this total, $273 million were products primary to other industries; and $79 million were receipts for miscellaneous activities. The industry shipments of primary products represented 70 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 70 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $815 million of creamery butter and anhydrous butterfat were shipped by all producers of these products. Of this total, $633 million, or 78 percent, were shipped by plants classified in Industry 2021, Creamery Butter, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 80 percent.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports

will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.—GENERAL STATISTICS FOR THE CREAMERY BUTTER INDUSTRY BY GEOGRAPHIC AREAS: 1963 AND 1958

(SIC code 2021)

1963 CENSUS OF MANUFACTURES

MC63(P)-20B-2

INDUSTRY SERIES

preliminary report

Natural and process cheese

SIC Code 2022

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Natural and Process Cheese Industry shipped products valued at $1,170 million, an increase of 34 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 6 percent from 1958 to a total of 18 thousand employees in 1963. Value added by manufacture amounted to $188 million in 1963, an increase of 41 percent from 1958.

The Natural and Process Cheese Industry includes establishments engaged primarily in the manufacture of natural cheese (except cottage cheese), process cheese, cheese foods and cheese spreads. This represents an amendment to the 1957 edition of the Standard Industrial Classification (SIC) Manual used for the 1958 Census of Manufactures. For 1958, establishments primarily engaged in the manufacture of natural cheese (except cottage cheese), or in the manufacture of process cheese from natural cheese produced in the same establishment were classified in Industry 2022, Natural Cheese. Establishments primarily producing process cheese, cheese food, cheese spreads, or related products from purchased natural cheese were classified in Industry 2025, Special Dairy Products.

Table 1.—GENERAL STATISTICS FOR THE NATURAL AND PROCESS CHEESE INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2022)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2] [3]	1,140	206	17,973	78,753	14,905	31,114	61,806	188,392	986,068	1,170,495	15,838
1958 (new)[3]	1,310	195	17,032	62,989	14,120	28,485	49,838	133,021	743,650	873,614	15,047
1958 (old)[3]	1,493	239	20,919	80,829	17,029	35,791	61,768	187,338	829,698	1,036,157	17,517
1954[4]	1,606	243	21,214	68,958	17,190	37,373	52,876	144,831	772,852	922,174	15,093
1947[4]	1,877	(NA)	20,248	47,284	17,064	38,352	37,794	113,491	648,736	762,227	(NA)

(NA) Not available.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2] In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3] This industry includes establishments formerly classified in Industry 2022, Natural Cheese, and Industry 2025, Special Dairy Products. See text regarding the revision in the industry definition as well as the comparability of the 1963 data with prior information.

[4] Data for Alaska and Hawaii are not included.

April 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

The prior year data shown for each of these industries have been combined to obtain information comparable to that shown for 1963.

For 1958, the SIC manual changed the definition for the two industries mentioned above from that used in 1954. Cottage cheese was transferred from Industry 2022, Natural Cheese, to Industry 2026, Fluid Milk, and processed cheese and cheese spreads made in integrated cheese plants were transferred from Industry 2025, Special Dairy Products, to Industry 2022, Natural Cheese. In addition, establishments primarily producing plastic cream, aerated cream, buttermilk, and flavored milk drinks were transferred to Industry 2026, Fluid Milk, from Industry 2025, Special Dairy Products. For this reason, two lines of data are shown for 1958. The 1958 "new" is comparable to 1963, while the 1958 "old" is comparable to 1954 and 1947.

The definitions for all the dairy industries had been substantially revised in 1947. Consequently, data prior to 1947 are not comparable to the information shown for subsequent years. However, in the 1947 Census of Manufactures report, information is shown for the census years prior to 1947 on a comparable basis.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958 and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Natural and Process Cheese Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Natural and Process Cheese Industry amounted to $1,170 million. Of this total, $99 million were products primary to other industries; and $62 million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 90 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $1,066 million of natural and process cheese products were shipped by all producers of these products. Of this total, $1,010 million, or 95 percent, were shipped by plants classified in Industry 2022, Natural and Process Cheese, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 96 percent.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or

shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.—GENERAL STATISTICS FOR THE NATURAL AND PROCESS CHEESE INDUSTRY BY GEOGRAPHIC AREAS: 1963 AND 1958

(SIC code 2022)

Geographic area	1963											1958	
	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new	All employees, number	Value added by manufacture

U.S. DEPARTMENT OF COMMERCE

1963 CENSUS OF MANUFACTURES

INDUSTRY SERIES

preliminary report

Condensed and evaporated milk

SIC Code 2023

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Condensed and Evaporated Milk Industry shipped products valued at $936 million, an increase of 14 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 9 percent from 1958 to a total of 12.2 thousand employees in 1963. Value added by manufacture amounted to $235 million in 1963, an increase of 16 percent from 1958.

The Condensed and Evaporated Milk Industry includes establishments engaged primarily in the manufacture of dry milk products and mixtures, canned milk products, concentrated milk, and ice cream mix.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.—GENERAL STATISTICS FOR THE CONDENSED AND EVAPORATED MILK INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2023)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	280	163	12,231	66,884	9,497	20,033	50,342	235,389	699,319	935,869	12,256
1958	313	202	13,445	61,443	10,758	23,237	46,547	202,709	613,743	820,649	14,900
1954[3]	359	192	13,310	50,513	10,900	24,583	39,338	165,295	531,023	703,298	25,733
1947[3] [4]	451	(NA)	18,250	47,352	15,028	33,711	37,639	156,739	624,656	781,395	(NA)

(NA) Not available.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

[4]Data prior to 1947 are not completely comparable to the information shown for subsequent years. However, in the 1947 Census of Manufactures report there is shown information for the census years 1904-1947 on a comparable basis.

April 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Condensed and Evaporated Milk Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Condensed and Evaporated Milk Industry amounted to $936 million. Of this total, $197 million were products primary to other industries; and $28 million were receipts for miscellaneous activities. The industry shipments of primary products represented 78 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 84 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $1,086 million of condensed and evaporated milk and related products were shipped by all producers of these products. Of this total, $711 million, or 65 percent, were shipped by plants classified in Industry 2023, Condensed and Evaporated Milk, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 69 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any

U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(X) Not applicable. r Revised.

[1] In 1958, information for weight control products and infants' dietary supplements, both liquid and dry, was collected as a single product and had a value of $38,577 thousand. This is included in the 1958 column in the $57,583 thousand shown for products 2023121, 2023123, and 2023128. For 1963, the liquid weight control products and infants' dietary supplements are included in product class 20232, Canned Milk Products. Therefore, to some extent the product and product class totals are not comparable.

[2] A review of the 1958 reporting indicates that a significant amount of bulk shipments of dry milk was reported as shipments in consumer type packages. While it was possible to make some revisions, the 1958 data shown for consumer packages are overstated and the food grade bulk shipments are understated.

[3] Quantity estimated based on quantity-value relationship for other products.

[4] The information was collected in pounds in 1958 and amounted to 916,678 thousand pounds.

1963 CENSUS OF MANUFACTURES

MC63(P)-20B-4

INDUSTRY SERIES

preliminary report

Ice cream and frozen desserts

SIC Code 2024

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Ice Cream and Frozen Desserts Industry shipped products valued at $1,072 million, an increase of 13 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 16 percent from 1958 to a total of 29.4 thousand employees in 1963. Value added by manufacture amounted to $432 million in 1963, an increase of 9 percent from 1958.

The Ice Cream and Frozen Desserts Industry includes establishments engaged primarily in the manufacture of ice cream, custard, water ices, sherbet, ice milk and other frozen desserts.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.—GENERAL STATISTICS FOR THE ICE CREAM AND FROZEN DESSERTS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2024)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	1,080	385	29,396	158,157	15,453	32,219	75,674	432,156	640,599	1,072,077	30,352
1958	1,382	454	34,795	153,950	18,673	37,673	72,442	394,686	557,286	951,499	26,150

1947[3]	1,690	(NA)	46,657	119,259	29,272	52,779	66,082	279,724	492,777	772,501	(NA)

(NA) Not available.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

[4]Prior to 1954, dairy plants were not treated as one group. The 1947 census excluded from manufacturing dairy plants which manufactured dairy products (butter, cheese, ice cream, etc.) if these plants also distributed fluid milk at retail. Although such plants were considered "nonmanufacturing," supplemental information on their operations was secured and tabulated separately. The 1954 census dairy industries were defined to include manufacturing dairy plants which distribute fluid milk at retail, and the 1947 data were retabulated to conform to the 1954 definitions.

March 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Ice Cream and Frozen Desserts Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Ice Cream and Frozen Desserts Industry amounted to $1,072 million. Of this total, $76 million were products primary to other industries; and $114 million were receipts for miscellaneous activities. The industry shipments of primary products represented 92 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 94 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $1,204 million of ice cream and frozen desserts were shipped by all producers of these products. Of this total, $882 million, or 73 percent, were shipped by plants classified in Industry 2024, Ice Cream and Frozen Desserts, while the remainder was shipped by plants classified in other industries. The comparable ratio for 1958 was 71 percent.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

INDUSTRY SERIES

preliminary report

Fluid milk SIC Code 2026

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Fluid Milk Industry shipped products valued at $7,007 million, an increase of 9 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 13 percent from 1958 and 6 percent from 1962 to a total of 185 thousand employees in 1963. Value added by manufacture amounted to $2,216 million in 1963, an increase of 11 percent from 1958 and a decrease of 2 percent from 1962.

The Fluid Milk Industry includes establishments engaged primarily in processing (i.e., pasteurizing, homogenizing, bottling) and distributing fluid milk and cream, and related products.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment.

Table 1.—GENERAL STATISTICS FOR THE FLUID MILK INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(NA) Not available. (X) Not applicable. rRevised.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

[4]Prior to 1954, the Standard Industrial Classification system did not include, as manufacturing, plants which pasteurized or bottled fluid milk. Those plants which primarily engaged in home service distribution of fluid milk were classified in retail trade, whereas those plants primarily distributing to other business firms were classified in wholesale trade.

[5]Not shown because of the inclusion of large number of small establishments for which man-hours data were not obtained.

[6]The 1948 data are from the 1948 Census of Business and include establishments classified as "Dairy products distributors," "Dairy-poultry products distributors," and "Retail milk dealers." Plants with no employees are excluded.

April 1965

in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Fluid Milk Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Fluid Milk Industry amounted to $7,007 million. Of this total, $608 million were products primary to other industries; and $632 million were receipts for miscellaneous activities. The industry shipments of primary products represented 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 90 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $6,051 million of fluid milk products were shipped by all producers of these products. Of this total, $5,767 million, or 95 percent, were shipped by plants classified in Industry 2026, Fluid Milk, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 95 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.—GENERAL STATISTICS FOR THE FLUID MILK INDUSTRY, BY GEOGRAPHIC AREAS: 1963 AND 1958

(SIC code 2026)

Geographic area	1963											1958

(X) Not applicable. rRevised.

[1]Quantity estimated based on quantity-value relationship reported for other products.

[2]In 1958, separate data were not collected for partial skim milk. A review of the 1958 reports for those plants shipping over $1 million of partial skim milk in 1963 indicates that they probably reported this product with whole milk in 1958.

[3]Includes whipped topping with non-butterfat base as well as whipped topping with a butterfat base. For 1963, information on whipped topping with non-dairy base is included in the report for Industry 2099, Food Preparations, N.E.C.

1963 CENSUS OF MANUFACTURES

MC63(P)-20C-1

INDUSTRY SERIES

preliminary report

Canned and cured seafoods

SIC Code 2031

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Canned and Cured Seafoods Industry produced products valued at $452 million, an increase of 16 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 1 percent from 1958 to a total of 17.3 thousand employees in 1963. Value added by manufacture amounted to $175 million in 1963, an increase of 34 percent from 1958.

The Canned and Cured Seafoods Industry includes establishments engaged primarily in cooking and canning fish, shrimp, oysters, clams, crabs, and other seafoods; and in smoking, salting, drying, or otherwise curing fish and other seafoods.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. rRevised.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

[4]The 1957 Standard Industrial Classification combined in this industry two industries which were separated in the 1954 Standard Industrial Classification. These were: Industry 2031, Canned Seafood, and Industry 2032, Canned Fish. The data for 1954 and earlier years for these two industries have been combined.

August 1965

BUREAU OF THE CENSUS, A. Ross Eckler, Director

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of production (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of production for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of production which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF PRODUCTION

The value of production reported by establishments classified in the Canned and Cured Seafoods Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of production and other receipts of establishments classified in the Canned and Cured Seafoods Industry amounted to $452 million. Of this total, $35 million were products primary to other industries; and $50 million were receipts for miscellaneous activities. The industry production of primary products represent 92 percent of the total manufactured products produced, primary and secondary. The 1958 ratio was 95 percent.

The total value of production for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $385 million of canned and cured seafood products were produced by all producers of these products. Of this total, $367 million, or 95 percent, were produced by plants classified in Industry 2031, Canned and Cured Seafoods, while the remainder was produced by plants classified in other industries. The 1958 ratio was 91 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of production, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the production by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any

U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

	Salted and pickled fish (including sun dried):				
20310 81	Sold for further processing	39,752	14,194	[r]9,347	3,822
20310 85	Sold as finished products ready for consumption	29,487	13,629	[r]32,331	13,168

[r]Revised.

[1]Since the Fish and Wildlife Service collected detailed information on commercial fisheries and fish processors, only limited product information was collected in the census of manufactures.

[2]In the census of manufactures, custom canners reported their receipts for contract work and did not report the quantity and value of their pack. This production is, however, included in the data published by the Fish and Wildlife Service. It is believed that this reporting difference resulted in the variation between the Census and Fish and Wildlife Service data. Contract receipts for custom canning for companies included in the Canned and Cured Seafoods Industry amounted to $2,784 thousand in 1958 and $7,900 thousand in 1963.

[3]May include a small amount of cured fish and other seafood, not specified by kind.

[4]Quantity estimated based on the quantity-value relationship reported for other products.

1963 CENSUS OF MANUFACTURES

MC63(P)-20C-2

INDUSTRY SERIES

preliminary report

Canned specialties

SIC Code 2032

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Canned Specialties Industry produced products valued at $1,166 million, an increase of 38 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 4 percent from 1958 to a total of 25.1 thousand employees in 1963. Value added by manufacture amounted to $536 million in 1963, an increase of 57 percent from 1958 and 13 percent from 1962.

The Canned Specialties Industry includes establishments engaged primarily in canning specialty products, such as baby food, dry beans, spaghetti, and soups, except seafood and frozen.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing

Table 1.—GENERAL STATISTICS FOR THE CANNED SPECIALTIES INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(NA) Not available. (X) Not applicable.

[1]Includes expenditures for plants under construction but not in operation.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]Prior to 1958, separate information is not available. A revision in the Standard Industrial Classification introduced in 1957 created Industry 2032, Canned Specialties. Most of the establishments classified in the new Industry 2032 were classified in Industry 2033, Canned Fruits and Vegetables, in 1954, but a few establishments shifted from Industry 2099, Food Preparations, N.E.C.

June 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. The figures for production workers, 1958-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

VALUE ADDED BY MANUFACTURE

For 1958-1963, value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of production (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of production which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF PRODUCTION

The value of production reported by establishments classified in the Canned Specialties Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of production and other receipts of establishments classified in the Canned Specialties Industry amounted to $1,166 million. Of this total, $216 million were products primary to other industries; and $90 million were receipts for miscellaneous activities. The industry's production of primary products represent 80 percent of the total manufactured products produced, primary and secondary. The 1958 ratio was 86 percent.

The total value of production for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry made by all producers. The latter figure, appearing in table 3, indicates that $943 million of canned specialty products were produced by all producers of these products. Of this total, $860 million, or 91 percent, were produced by plants classified in Industry 2032, Canned Specialties, while the remainder was produced by plants classified in other industries. The 1958 ratio was 83 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of production, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the production by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.—GENERAL STATISTICS FOR THE CANNED SPECIALTIES INDUSTRY BY GEOGRAPHIC AREAS: 1963 AND 1958

(SIC code 2032)

Geographic area	1963											1958

California	30	10	3,320	18,876	2,716	5,244	14,004	78,094	87,689	165,881	2,530	3,051	60,085

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.)

(D) Withheld to avoid disclosing figures for individual companies.

[1] Less than $500 thousand.

Table 3.—QUANTITY AND VALUE OF CANNED SPECIALTIES MANUFACTURED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958

(Includes quantity and value of these products reported not only by establishments classified in the Canned Specialties Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Production")

1963 CENSUS OF MANUFACTURES

MC63(P)-20C-3

INDUSTRY SERIES

preliminary report

Canned fruits and vegetables

SIC Code 2033

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Canned Fruits and Vegetables Industry produced products valued at $2,730 million, an increase of 23 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 6 percent from 1958 and 2 percent from 1962 to a total of 102 thousand employees in 1963. Value added by manufacture amounted to $1,030 million in 1963, an increase of 21 percent from 1958 and 6 percent from 1962.

The Canned Fruits and Vegetables Industry includes establishments engaged primarily in canning fruits and vegetables, and fruits and vegetable juices; and in manufacturing catsup and similar tomato sauces, jams, jellies, and preserves.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years.

Table 1.—GENERAL STATISTICS FOR THE CANNED FRUITS AND VEGETABLES INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2033)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of production	Capital expenditures, new[1]	Standard error of estimate (percent) for number of employees column[2]

(NA) Not available. (X) Not applicable.

[1]Includes expenditures for plants under construction but not in operation.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Mamufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]The Standard Industrial Classification followed in the 1958 Census and in subsequent years substantially revised the definition for this industry. The description of the changes and comparable data for years prior to 1958 are included in the canned and frozen section, 20C, of the 1958 Census of Manufactures, Volume II, Industry Statistics, Part 1.

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. The figures for production workers, 1958-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

VALUE ADDED BY MANUFACTURE

For 1958-1963, value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of production (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of production which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF PRODUCTION

The value of production reported by establishments classified in the Canned Fruits and Vegetables Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of production and other receipts of establishments classified in the Canned Fruits and Vegetables Industry amounted to $2,730 million. Of this total, $206 million were products primary to other industries; and $179 million were receipts for miscellaneous activities. The industry's production of primary products represent 92 percent of the total manufactured products produced, primary and secondary. The 1958 ratio was 89 percent.

The total value of production for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry produced by all producers. The latter figure, appearing in table 3, indicates that $2,572 million of canned fruit and vegetable products were produced by all producers of these products. Of this total, $2,346 million, or 91 percent, were produced by plants classified in Industry 2033, Canned Fruits and Vegetables, while the remainder was produced by plants classified in other industries. The 1958 ratio was 90 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of production, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the production by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.)

(D) Withheld to avoid disclosing figures for individual companies.

[1]Less than $500 thousand.

Table 3.—QUANTITY AND VALUE OF CANNED FRUITS AND VEGETABLES PACKED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958

(Includes quantity and value of these products reported not only by establishments classified in the Canned Fruits and Vegetables Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

Product code	Product	Unit of measure	Total production (pack)

20338 61	Maraschino cherries (excluding glacé and candied)	1,000 gallons	5,565	19,321	r5,938	18,009
20338 71	Dietetic jams, jellies, and preserves	1,000 pounds	6,746	1,850	([6])	([6])
20338 00	Jams, jellies, and preserves, not specified by kind	...	(X)	13,511	(X)	r22,790
20330 00	Canned fruits and vegetables, preserves, jams and jellies, not specified by kind	...	(X)	62,050	(X)	47,419

Note: In the 1958 Census, quantity and value data were collected for the canned fruits and vegetables. The quantity data by can sizes were based on percentages supplied by the National Canners Association. In the 1963 Census for the major products, quantity and value data were collected for two categories; the largest can size and all other can sizes combined. The quantity data for the "All other can sizes" are further allocated by can sizes based on percentages supplied by the National Canners Association. For such cases, the value data are not available.

-Represents zero. (NA) Not available. (X) Not applicable. rRevised.

[1]Quantity data estimated based on the quantity-value relationship reported for other products in the product class.

[2]For 1958, data for sweet corn, cream style, are included with sweet corn, whole kernel.

[3]Separate data for fresh fruit juices were not collected in the 1958 Census. A review of the 1958 Census schedules for those companies accounting for approximately 80% of the reported value of fresh fruit juice in 1963 indicated that in 1958 this product was included with orange juice, single strength, 1963 product codes 2033442 and 2033443, or frozen juice, not specified by kind, 1963 product code 2037100. For these establishments, the 1958 data have been retabulated. However, since the retabulation was not made for all producers of fresh fruit juices, the 1958 data are probably understated while the data for orange juice, single strength, and frozen fruit juices, not specified by kind are overstated.

[4]Product code 2033485 was combined with product code 2033400 to avoid disclosing figures for individual companies.

[5]Includes a substantial quantity made from purchased puree.

[6]Separate data for this product were not collected in 1958 and were included with other jams, jellies and preserves.

1963 CENSUS OF MANUFACTURES

MC63(P)-20C-A

INDUSTRY SERIES

preliminary report

Dehydrated foods products

SIC Code 2034

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Dehydrated Foods Products Industry shipped products valued at $321 million, an increase of 18 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 23 percent from 1958 to a total of 9.3 thousand employees in 1963. Value added by manufacture amounted to $117 million in 1963, an increase of 54 percent from 1958.

The Dehydrated Foods Products Industry includes establishments engaged primarily in the manufacture of dried and dehydrated fruits and vegetables and freeze dried products.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.—GENERAL STATISTICS FOR THE DEHYDRATED FOODS PRODUCTS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2034)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	175	79	9,333	42,346	8,076	15,742	31,973	117,337	209,917	321,187	16,317
1958	161	67	7,599	28,338	6,638	12,781	21,791	75,529	188,220	273,286	6,686
1954[3]	148	64	7,011	22,026	6,102	11,678	16,477	56,039	139,182	194,524	3,421
1947[3]	146	(NA)	3,976	8,145	3,662	7,318	6,834	18,155	32,924	51,079	1,750

(NA) Not available.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2] In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3] Data for Alaska and Hawaii are not included.

March 1965

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Dehydrated Foods Products Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Dehydrated Foods Products Industry amounted to $321 million. Of this total, $13 million were products primary to other industries; and $8 million were receipts for miscellaneous activities. The industry shipments of primary products represented 96 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 97 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $335 million of dehydrated foods products were shipped by all producers of these products. Of this total, $299 million, or 89 percent, were shipped by plants classified in Industry 2034, Dehydrated Foods Products, while the remainder was shipped by plants classified in other industries. The comparable ratio for 1958 was 93 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses

of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.—GENERAL STATISTICS FOR THE DEHYDRATED FOODS PRODUCTS INDUSTRY, BY GEOGRAPHIC AREAS: 1963 AND 1958

(SIC code 2034)

Geographic area	1963											1958	
	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new	All employees, number	Value added by manufacture
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)		($1,000)

1963 CENSUS OF MANUFACTURES

MC63(P)-20C-5

INDUSTRY SERIES

preliminary report

Pickles, sauces, salad dressings

SIC Code 2035

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Pickles, Sauces, and Salad Dressing Industry produced products valued at $676 million, an increase of 29 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 3 percent from 1958 to a total of 19 thousand employees in 1963. Value added by manufacture amounted to $248 million in 1963, an increase of 50 percent from 1958.

The Pickles, Sauces, and Salad Dressing Industry includes establishments engaged primarily in the pickling and brining of fruits and vegetables, and in the manufacture of salad dressings, vegetable relishes and sauces.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment

Table 1.—GENERAL STATISTICS FOR THE PICKLES, SAUCES, AND SALAD DRESSING INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

1939[4 5]	511	(NA)	15,705	15,931	12,464	(NA)	9,827	41,087	80,492	121,579	(NA)

(NA) Not available.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2] In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3] The data for 1958 (old) and earlier years were based on the old Standard Industrial Classification definition of Industry 2035, which includes establishments primarily engaged in making tomato sauce. Under the revised edition of the SIC Manual in use since 1958, establishments primarily engaged in making tomato sauce are included in Industry 2033, Canned Fruits and Vegetables.

[4] Data for Alaska and Hawaii are not included.

[5] The figures for 1939 were obtained by combining figures for the former industries "Pickled fruits and vegetables, etc." and "Salad dressings."

July 1965

in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of production (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of production for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of production which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF PRODUCTION

The value of production reported by establishments classified in the Pickles, Sauces, and Salad Dressing Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of production and other receipts of establishments classified in the Pickles, Sauces, and Salad Dressing Industry amounted to $676 million. Of this total, $139 million were products primary to other industries; and $30 million were receipts for miscellaneous activities. The industry shipments of primary products represent 78 percent of the total manufactured products produced, primary and secondary. The 1958 ratio was 81 percent.

The total value of production for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $613 million of pickles, sauces, and salad dressing products were produced by all producers of these products. Of this total, $506 million, or 82 percent, were made by plants classified in Industry 2035, Pickles, Sauces, and Salad Dressing, while the remainder was produced by plants classified in other industries. The 1958 ratio was 82 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of production, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the production by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses

of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(NA) Not available. (X) Not applicable. rRevised.

[1]Quantity estimated based on quantity-value relationship reported for other products.

[2]The census and current survey data for this product class differ because some small plants were omitted from the current survey and there were reporting differences for some companies furnishing data in both surveys. It is expected that the complete list of producers of salad dressing and mayonnaise from the census of manufactures will be available in the near future and will be used as a basis for revisions to the data published in Current Industrial Reports Series M20F, "Salad Dressing and Mayonnaise." Revisions to this series or in the final census of manufactures report will also be made for those plants reporting different figures in each of the two surveys.

U.S. DEPARTMENT OF COMMERCE

1963 CENSUS OF MANUFACTURES

MC63(P)-20C-5

INDUSTRY SERIES

preliminary report

Fresh or frozen packaged fish

SIC Code 2036

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Fresh or Frozen Packaged Fish Industry produced products valued at $391 million, an increase of 27 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 14 percent from 1958 to a total of 20 thousand employees in 1963. Value added by manufacture amounted to $118 million in 1963, an increase of 42 percent from 1958.

The Fresh or Frozen Packaged Fish Industry includes establishments engaged primarily in the preparing of fresh or frozen packaged fish or other seafood. This industry also includes establishments primarily engaged in the shucking and packaging of fresh oysters and clams in nonsealed containers.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE FRESH OR FROZEN PACKAGED FISH INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2036)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of production	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	547	255	20,066	56,471	17,930	32,147	44,548	118,381	272,746	391,174	6,070
1958	440	223	17,613	41,432	15,580	26,178	32,339	83,504	226,897	307,399	3,673
1954[3] [4]	295	135	12,200	27,190	11,232	18,779	21,549	48,729	129,502	176,766	2,813

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

[4]Prior to 1954 many establishments, now classified in Industry 2036, were classified in Wholesale Trade SIC 5049 and included in the census of business. Figures for years prior to 1954 are therefore not available.

May 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. **10 cents.**

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of production (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of production which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF PRODUCTION

The values reported by establishments classified in the Fresh or Frozen Packaged Fish Industry consist not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of production and other receipts of establishments classified in the Fresh or Frozen Packaged Fish Industry amounted to $391 million. Of this total, $22 million were products primary to other industries; and $34 million were receipts for miscellaneous activities. The industry production of primary products represent 94 percent of the total manufactured product production, primary and secondary. The 1958 ratio was 93 percent.

The total value of production for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry produced by all manufacturers. The latter figure, appearing in table 3, indicates that $355 million of fresh and frozen packaged fish products were produced by all producers of these products. Of this total, $335 million, or 94 percent, were produced by plants classified in Industry 2036, Fresh or Frozen Packaged Fish, while the remainder was produced by plants classified in other industries. The 1958 ratio was 96 percent.

Establishments in this industry were asked to report their value of production rather than value of shipments as usually reported in the census of manufactures. However, commission plants packaging fish or shellfish owned by others reported the commission receipts received rather than the value of the packaged seafood. To the extent that the packaging is performed for nonmanufacturing companies, the products are excluded from table 3. Also excluded are products packaged at nonmanufacturing locations such as cold storage warehouses.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of production, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the production by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment" and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any

U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

[1]Excludes a substantial amount of shrimp frozen at manufacturing plants and cold storage warehouses on a contract basis for nonmanufacturing companies. The Fish and Wildlife Service, Department of the Interior, estimates that 169,000 thousand pounds of shrimp with a value of $132,000 thousand were frozen in 1963.

[2]Quantities are estimated based on the quantity-value relationship reported for other products.

1963 CENSUS OF MANUFACTURES

MC63(P)-20C-7

INDUSTRY SERIES

preliminary report

Frozen fruits and vegetables

SIC Code 2037

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Frozen Fruits and Vegetables Industry produced products valued at $1,535 million, an increase of 50 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 31 percent from 1958 and 14 percent from 1962 to a total of 51.8 thousand employees in 1963. Value added by manufacture amounted to $538 million in 1963, an increase of 66 percent from 1958 and 26 percent from 1962.

The Frozen Fruits and Vegetables Industry includes establishments engaged primarily in quick freezing and cold packing (freezing) of fruits, fruit juices, vegetables, and specialties.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable. rRevised.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2] The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the annual survey of manufactures volumes for further discussion of the sampling estimate.

[3] The data for 1958 (old) and earlier years were based on the old Standard Industrial Classification of Industry 2037 which excluded establishments primarily freezing and packing prepared foods such as frozen meat and poultry pies, baked goods, and complete dinners. The establishments were included in Industry 2099, Food Preparations, N.E.C. Under the revised edition of the Standard Industrial Classification in use since 1958, Industry 2037 now includes establishments primarily freezing and packing prepared foods.

[4] Data for Alaska and Hawaii are not included.

[5] The figures published originally for 1939 have been revised to include statistics for 25 establishments engaged primarily in cold packing fruits and vegetables. Value added for 1939 before revision was $3.9 million.

August 1965

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. **10 cents.**

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of production (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of production for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of production which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF PRODUCTION

The value of production reported by establishments classified in the Frozen Fruits and Vegetables Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of production and other receipts of establishments classified in the Frozen Fruits and Vegetables Industry amounted to $1,535 million. Of this total, $153 million were products primary to other industries; and $86 million were receipts for miscellaneous activities. The industry production of primary products represent 89 percent of the total manufactured products produced, primary and secondary. The 1958 ratio was 88 percent.

The total value of production for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $1,455 million of frozen fruit and vegetable products were produced by all producers of these products. Of this total, $1,296 million, or 89 percent, were produced by plants classified in Industry 2037, Frozen Fruits and Vegetables, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 91 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of production, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the production by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(X) Not applicable. rRevised.

[1]Census figures on the production of frozen fruits and vegetables are generally less than those developed by the National Association of Frozen Food Packers. The difference is more significant for fruits than for vegetables. Although a complete explanation of the lower census figures is not yet known, the census of manufactures excludes the following types of production: (1) products frozen on farms, at cold storage warehouses and locker plants, and at establishments engaged primarily in wholesale or retail trade, (2) frozen fruits and vegetables packed under contract for which the packer is required to report only "commission receipts."

[2]Data have been revised to exclude $11,713 thousand of fresh chilled fruit juice which is now collected as a separate item in Industry 2033, Canned Fruits and Vegetables, under product code 2033491, "Fruit juices, fresh, to be kept under refrigeration (orange, grape, etc.)."

[3]Includes combinations of frozen vegetables.

[4]Quantity estimated based on the quantity-value relationship reported for other products.

[5]Data on frozen seafood soups are included in product code 2036119 in Industry 2036, Fresh or Frozen Packaged Fish.

[6]Excludes frozen soup, other than seafood soup, which was combined in 1958 with "canned soups" under 1963 product codes 2032400 and 2032000 in Industry 2032, Canned Specialties.

1963 CENSUS OF MANUFACTURES

MC63(P)-20D-1

INDUSTRY SERIES

preliminary report

Flour mills and Blended and prepared flour

SIC Codes 2041 and 2045

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in Flour Mills shipped products valued at $2,186 million, an increase of 5 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 21 percent from 1958 and 13 percent from 1962 to a total of 22.4 thousand employees in 1963. Value added by manufacture amounted to $383 million in 1963, a decrease of 3 percent from 1958 and 13 percent from 1962.

During 1963, manufacturers in the Blended and Prepared Flour Industry shipped products valued at $432 million. Average employment in this industry was 7.2 thousand employees and value added by manufacture amounted to $177 million in 1963.

Flour Mills include establishments engaged primarily in milling flour and meal from grain, except rice. The products of flour mills may be sold plain or in the form of prepared mixes for specific purposes.

The Blended and Prepared Flour Industry includes establishments engaged primarily in the manufacture of blended flours and flour mixes from purchased flour. This industry also includes

Table 1A.—GENERAL STATISTICS FOR FLOUR MILLS IN THE UNITED STATES FOR SELECTED YEARS

(NA) Not available. (X) Not applicable.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2] The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3] Data for Alaska and Hawaii are not included.

[4] The figures for 1939 include data for two establishments making soy flour. Although soy flour is now classified in the "Soybean Oil Mills" Industry, the data for these two establishments have been included in the 1939 figure for "Flour Mills" to avoid disclosure of their figures.

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

establishments engaged primarily in producing refrigerated doughs from purchased flour. Prior to 1963, refrigerated doughs were not specifically listed on the report forms. Where it was reported, the product and usually the plant were classified in either Industry 2037, "Frozen Food Products," or in Industry 2099, "Miscellaneous Food Products," depending upon the description of the refrigerated dough furnished by the respondent. A review of the reports for 1958-1962 indicated that it was not feasible to retabulate the data for this industry (2045) to include the refrigerated dough producers. Therefore, in order to obtain 1963 data comparable to that shown for prior years, the information is shown in table 1B under the new industry classification which includes the refrigerated dough plants and under the old industry classification which excludes the refrigerated dough plants.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period. The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified as Flour Mills consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified as Flour Mills amounted to $2,186 million. Of this total, $78 million were products primary to other industries; and $108 million were receipts for miscellaneous activities. The industry shipments of primary products represent 96 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $2,463 million of flour mill products and blended and prepared flour products were shipped by all producers of these products. Of this total, $2,000 million, or 81 percent, were shipped by plants classified in Industry 2041, Flour Mills, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 85 percent.

The value of shipments reported by establishments classified in the Blended and Prepared Flour Industry amounted to $432 million. Of this total,

$92 million were products primary to other industries; and 18 million were receipts for miscellaneous activities. The industry shipments of primary products represent 78 percent of the total manufactured product shipments, primary and secondary.

The total value of blended and prepared flour shipped by all producers in 1963, as indicated in table 3 was $502 million. Of this total, $322 million, or 64 percent, were shipped by plants classified in Industry 2045, Blended and Prepared Flour, while the remainder was shipped by plants classified in other industries.

COMPARABILITY OF CENSUS AND CURRENT SURVEY DATA

The Census Bureau also conducts a monthly survey of flour mill production. These data are published in Current Industrial Reports Series M20A, Flour Milling Products. The annual summary in this series includes data for wheat ground, wheat flour and millfeed production, and flour mill capacity and stocks. Similar data are collected for rye and semi-annual data in less detail for durum wheat.

Figures for the various product categories differ somewhat in the current survey and the census of manufactures. The current survey data are based on a sample of flour millers, while all such companies are included in the census of manufactures. Fiscal year reporting also resulted in some differences for individual companies. These companies reported in the census of manufactures on a fiscal year basis, while their current survey reports are filed monthly and cumulated to a calendar year's total.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1A, 1B, and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1A, 1B, and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

n.e.c. Not elsewhere classified. (X) Not applicable. r Revised.

[1] In 1958, the separate reporting of refrigerated doughs was not requested; therefore, all data for refrigerated doughs are excluded from this report.

[2] Separate reporting was requested for phosphated and self-rising flour. In 1963, a substantial number of flour mills included their shipments of such flour with white family flour. The reported information for flour mills was therefore combined with these products. Since the output of self-rising and phosphated flours was reported separately by flour blenders and would duplicate the flour production at flour mills, this information is shown separately in product class 20455.

[3] Quantity estimated based on average quantity-value relationship of other products in the product class or industry.

[4] Data for product codes 2041573 and 2045573 are included with product codes 2041579 and 2045579 to avoid disclosing figures for individual companies.

1963 CENSUS OF MANUFACTURES

MC63(P)-20D-2

INDUSTRY SERIES

preliminary report

Prepared animal feeds

SIC Code 2042

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Prepared Animal Feeds Industry shipped products valued at $3,863 million, an increase of 19 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 4 percent from 1958 and 2 percent from 1962 to a total of 55.1 thousand employees in 1963. Value added by manufacture amounted to $920 million in 1963, an increase of 15 percent from 1958 and 4 percent from 1962.

The Prepared Animal Feeds Industry includes establishments engaged primarily in the manufacture of prepared feed for animals and fowls. Prepared feeds include poultry feed, livestock feed, dog food and other pet foods (canned, frozen, and dry). This industry also includes establishments primarily engaged in manufacturing certain feed ingredients and adjuncts, such as alfalfa meal, feed supplements, and feed concentrates.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

Table 1.--GENERAL STATISTICS FOR THE PREPARED ANIMAL FEEDS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(NA) Not available. (X) Not applicable.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

April 1965

and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Prepared Animal Feeds Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Prepared Animal Feeds Industry amounted to $3,863 million. Of this total, $206 million were products primary to other industries; and $318 million were receipts for miscellaneous activities. The industry shipments of primary products represented 94 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 97 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $3,604 million of prepared animal feeds were shipped by all producers of these products. Of this total, $3,332 million, or 92 percent, were shipped by plants classified in Industry 2042, Prepared Animal Feeds, while the remainder was shipped by plants classified in other industries.

COMPARABILITY OF CENSUS AND CURRENT SURVEY DATA

Since 1961, data have been published each year in Current Industrial Reports Series M20E, Poultry and Livestock Feed Production. While this survey includes such nonmanufacturing establishments as grain elevators, feed supply stores, etc., separate 1963 estimates were previously published for manufacturing establishments. Such estimates exceeded the census of manufactures figures for complete feeds by 5 percent while they were 9 percent lower for supplements and concentrates.

It is believed that the primary reason for these differences is that all manufacturing plants are included in the census of manufactures data while the current survey data are collected from a sample panel which was based on the 1958 classification for each establishment. A more comprehensive review of the differences in the two reports is planned prior to the issuance of the 1964 M20E report.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.—GENERAL STATISTICS FOR THE PREPARED ANIMAL FEEDS INDUSTRY, BY GEOGRAPHIC AREAS: 1963 AND 1958

(SIC code 2042)

Geographic area	1963											1958

1963 CENSUS OF MANUFACTURES

MC63(P)-20D-3

INDUSTRY SERIES

preliminary report

Cereal preparations

SIC Code 2043

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Cereal Preparations Industry shipped products valued at $674 million, an increase of 52 percent over 1958 according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 10 percent from 1958 and a decrease of 1 percent from 1962 to a total of 12.0 thousand employees in 1963. Value added by manufacture amounted to $391 million in 1963, an increase of 61 percent from 1958 and 20 percent from 1962.

The Cereal Preparations Industry includes establishments engaged primarily in the manufacture of cereal breakfast foods and related preparations. Establishments primarily engaged in manufacturing hominy grits for human consumption are classified in Industry 2041, Flour and Other Grain Mill Products.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE CEREAL PREPARATIONS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2043)

(X) Not applicable. (NA) Not available.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

[4]This industry contains a number of small establishments some of which may have been misclassified as to industry. This would not affect the statistics other than the number of establishments.

February 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Cereal Preparations Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Cereal Preparations Industry amounted to $674 million. Of this total, $147 million were products primary to other industries and $27 million were receipts for miscellaneous activities. The industry shipments of primary products represented 77 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 80 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $561 million of cereal preparations were shipped by all producers of these products. Of this total, $499 million, or 89 percent, were shipped by plants classified in Industry 2043, Cereal Preparations, while the remainder was shipped by plants classified in other industries. In 1958 the comparable ratio was 82.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any

U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.--GENERAL STATISTICS FOR THE CEREAL PREPARATIONS INDUSTRY, BY REGIONS AND STATES: 1963 AND 1958

(SIC code 2043)

Region	1963											1958	
	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new	All employees, number	Value added by manufacture

1963 CENSUS OF MANUFACTURES

MC63(P)-200-4

INDUSTRY SERIES

preliminary report

Rice milling SIC Code 2044

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Rice Milling Industry shipped products valued at $423 million, an increase of 36 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 11 percent from 1958 to a total of 4.3 thousand employees in 1963. Value added by manufacture amounted to $80 million in 1963, an increase of 50 percent from 1958.

The Rice Milling Industry includes establishments engaged primarily in cleaning and polishing rice. The important products of this industry include milled rice (including polished rice), brewers rice, and rice bran. A few small establishments processing wild rice are also included in the industry.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.—GENERAL STATISTICS FOR THE RICE MILLING INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2044)

1939[3]	72	(NA)	3,218	3,094	2,346	(NA)	1,533	8,561	33,802	42,363	(NA)

(NA) Not available. rRevised.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

February 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939,all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Rice Milling Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Rice Milling Industry amounted to $423 million. Of this total, $407 million were products primary to this industry; and $16 million were receipts for miscellaneous activities. The shipments of products primary to other industries was less than one million dollars. The industry shipments of primary products represented 100 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 100 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $407 million of rice milling products were shipped by all producers of these products. All of this total, or 100 percent, were shipped by plants classified in Industry 2044, Rice Milling. This was also the case in 1958.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

INDUSTRY SERIES

preliminary report

Wet corn milling

SIC Code 2046

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Wet Corn Milling Industry shipped products valued at $622 million, an increase of 18 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 4 percent from 1958 and 5 percent from 1962 to a total of 13.2 thousand employees in 1963. Value added by manufacture amounted to $291 million in 1963, an increase of 17 percent from 1958 and 5 percent from 1962.

The Wet Corn Milling Industry includes establishments engaged primarily in milling corn or sorghum grain (milo) by the wet process, and producing starch, sirup, oil, sugar, and byproducts, such as gluten feed and meal. Establishments primarily engaged in manufacturing starch from other vegetable sources (potato, wheat, etc.) are also included.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further explanation of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

January 1965

and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels from 1958 to 1963.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Wet Corn Milling Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Wet Corn Milling Industry amounted to $622 million. Of this total, $80 million were products primary to other industries; and $10 million were receipts for miscellaneous activities. The industry shipments of primary products represented 87 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 91 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $552 million of wet corn milling products were shipped by all producers of these products. Of this total, $532 million, or 96 percent, were shipped by plants classified in Industry 2046, Wet Corn Milling, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was also 96.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries, and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary

products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.--GENERAL STATISTICS FOR THE WET CORN MILLING INDUSTRY BY REGIONS AND STATES: 1963 AND 1958

(SIC code 2046)

Region and State	1963											1958	
	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new	All employees, number	Value added by manufacture

1963 CENSUS OF MANUFACTURES

MC63(P)-20E-1

INDUSTRY SERIES

preliminary report

Bread and related products

SIC Code 2051

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Bread and Related Products Industry shipped products valued at $4,473 million, an increase of 7 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment of this industry was 238 thousand employees in 1963. Value added by manufacture amounted to $2,372 million in 1963, an increase of 12 percent from 1958 and 1 percent from 1962.

The Bread and Related Products Industry includes establishments engaged primarily in the manufacture of bread, cakes, sweet yeast goods,

Table 1.—GENERAL STATISTICS FOR THE BREAD AND RELATED PRODUCTS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(NA) Not available. (X) Not applicable. [r]Revised.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the annual survey of manufactures volumes for further discussion of the sampling estimate.

[3]The report form for the bakery industry includes a check-box inquiry which is used to identify single-shop retail bakeries. These bakeries are classified as retailers and are included in the Census of Business. To the extent that the respondents completed this inquiry, all such retailers were excluded from the 1963 Census of Manufactures. However, for 1958 and 1954, there were about 2,000 small establishments reporting on "short forms" that were not subjected to the same kind of analysis as in 1963. For 1958, this group had 18,884 employees and $119,800 thousand adjusted value added. A review of these 1958 report forms indicated that while the great majority was wholesale bakeries, a number were single-shop retail bakeries. Their inclusion in 1958 and exclusion in 1963 may account for some of the reduction since 1958 of the number of establishments. Prior to the issuance of the final 1963 report for this industry, a further review of the 1958 reports is planned in order to obtain an estimate of the employment and the number of single-shop bakeries that were included in the 1958 Census.

[4]Data for Alaska and Hawaii are not included.

[5]Figures were obtained from a retabulation of 1939 Census reports classified in accordance with present industry definitions and, except for production workers, are comparable with figures since 1939.

[6]Estimated by applying to retabulated data on number and wages of production workers the following ratios, respectively, computed from published 1939 statistics: (1) total number of employees to number of production workers in establishments classified as "Wholesale" and "Wholesale and Retail" and (2) wages paid to all employees to wages paid to production workers in the same categories.

[7]Figures are for wage earners, including driver-salesmen, and are not comparable with later years. Analysis of a sample of 1939 returns indicates that somewhat over 40 percent of these wage earners were driver-salesmen.

May 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

doughnuts, pies, pastries and similar perishable bakery products for off-premise sale. Establishments producing bakery products for direct sale to consumers on premises are classified in Retail Trade.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Bread and Related Products Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Bread and Related Products Industry amounted to $4,473 million. Of this total, $99 million were products primary to other industries; and $616 million were receipts for miscellaneous activities. The industry shipments of primary products represented 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 98 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $3,791 million of bread and related products were shipped by all manufacturing plants producing these products. Of this total, $3,758 million, or 99 percent, were shipped by plants classified in Industry 2051, Bread and Related Products, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 99 percent. The data shown in table 3A are limited to shipments by manufacturing plants and exclude baked goods produced in single-shop retail bakeries.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

1963 CENSUS OF MANUFACTURES

MC63(P)-202.2

INDUSTRY SERIES

preliminary report

Biscuit, crackers and cookies

SIC Code 2052

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Biscuit, Crackers and Cookies Industry shipped products valued at $1,152 million, an increase of 17 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 3 percent from 1958 to a total of 43.1 thousand employees in 1963. Value added by manufacture amounted to $628 million in 1963, an increase of 20 percent from 1958.

The Biscuit, Crackers and Cookies Industry includes establishments engaged primarily in manufacturing biscuit (except raised biscuit), crackers, and similar "dry" bakery products. Included among the products of this industry are pretzels and ice cream cones.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.—GENERAL STATISTICS FOR THE BISCUIT, CRACKERS AND COOKIES INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2052)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	359	209	43,120	213,285	34,056	67,866	150,875	628,298	523,507	1,151,715	26,087
1958[3] (new)	339	206	44,461	179,829	34,296	68,483	122,659	523,318	456,785	982,545	15,521
1958[3] (old)	304	183	43,111	175,038	33,279	66,576	119,741	503,446	446,344	955,509	15,183
1954[4]	311	168	44,763	150,880	35,700	68,509	109,019	420,132	387,531	806,753	13,094
1947[4]	326	187	46,058	109,223	37,526	(NA)	78,361	264,973	275,249	540,222	14,241
1939[4]	356	(NA)	35,930	42,039	29,173	(NA)	28,550	118,743	82,050	200,793	(NA)

(NA) Not available.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]The data for 1958 (old) and earlier years were based on the old Standard Industrial Classification of Industry 2052, which excluded establishments primarily making ice cream cones and cups. These establishments were included in Industry 2099, Food Preparations, N.E.C. Under the revised edition of the SIC Manual in use since 1958, Industry 2052 includes establishments primarily making ice cream cones and cups.

[4]Data for Alaska and Hawaii are not included.

April 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Biscuit, Crackers and Cookies Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Biscuit, Crackers and Cookies Industry amounted to $1,152 million. Of this total, $29 million were products primary to other industries; and $48 million were receipts for miscellaneous activities. The industry shipments of primary products represented 97 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 97 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $1,133 million of biscuit, crackers and cookies products were shipped by all producers of these products. Of this total, $1,075 million, or 95 percent, were shipped by plants classified in Industry 2052, Biscuit, Crackers and Cookies, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 94 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any

U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(X) Not applicable. rRevised.

[1]In both 1958 and 1963, products such as melba toast were not prelisted on the Census report form. However, if the respondent reported and described this product separately, the data were included in the combined total shown for product codes 2052131 and 2052135 in 1958 and in product code 2052200 for 1963.

[2]Information for cracker sandwiches, made from purchased crackers, is included in the report for Industry 2099, Food Preparations, N.E.C.

[3]Quantity estimated based on quantity-value relationship reported for other products.

[4]Includes hand-made cookies amounting to 62,668 thousand pounds baked weight with a value of $23,048 thousand which was tabulated as part of Industry 2051, Bread and Other Related Products, in 1958.

1963 CENSUS OF MANUFACTURES

MC63(P)-20F-1

INDUSTRY SERIES

preliminary report

Raw cane sugar

SIC Code 2061

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Raw Cane Sugar Industry shipped products valued at $378 million, according to preliminary results obtained from the 1963 census. Average employment in this industry was 8.3 thousand employees and value added by manufacture amounted to $132 million in 1963.

The 1958 and prior years' data excluded establishments located in Hawaii. To obtain comparable information, the 1963 data are shown in table 1 on two lines, including Hawaii and excluding Hawaii.

In table 2, the 1958 data for Hawaii include one plant classified in Industry 2062, Cane Sugar Refining, while the 1958 data in table 3 have been revised to include shipments by Hawaiian plants.

The Raw Cane Sugar Industry includes establishments engaged primarily in the manufacture of raw sugar, sirup, or finished cane sugar from sugar cane. Establishments primarily engaged in refining sugar from purchased raw cane sirup or sugar sirups are classified in Industry 2062, Cane Sugar Refining.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957

Table 1.—GENERAL STATISTICS FOR THE RAW CANE SUGAR INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2061)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963 (including Hawaii)[2] [3]	74	73	8,265	38,796	6,358	14,569	27,878	132,440	251,888	378,183	17,470
1963 (excluding Hawaii)[3]	50	49	3,949	18,457	3,281	8,399	14,678	63,035	129,368	186,258	9,891
1958[3] [4]	50	44	3,011	9,388	2,581	5,844	7,498	21,841	50,234	72,553	1,815
1954[3] [4]	49	43	3,078	8,949	2,719	7,231	7,307	17,640	49,275	64,715	2,659
1947[3] [4]	82	(NA)	4,635	8,550	4,022	10,217	6,597	17,709	41,595	60,135	5,061
1939[3] [4]	78	(NA)	5,294	3,731	4,217	(NA)	2,573	10,510	22,100	32,600	(NA)

(NA) Not available.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]Since 1947, data shown have generally covered the calendar year except for some producers who reported for the season beginning in those years. However, for those establishments reporting for the season beginning in those years, they reported employment and payroll for the calendar year. The data for 1939 cover the season beginning in that year.

[4]Data for Alaska and Hawaii are not included.

April 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

edition of the Standard Industrial Classification (SIC) Manual, as amended to date.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Raw Cane Sugar Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Raw Cane Sugar Industry amounted to $378 million. Of this total, $5 million were products primary to other industries and receipts for miscellaneous activities. The industry shipments of primary products were approximately 100 percent of the total manufactured product shipments, primary and secondary.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $373 million of raw cane sugar products were shipped by all producers of these products. Of this total, $373 million, or 100 percent, were shipped by plants classified in Industry 2061, Raw Cane Sugar.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses

of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

1963 CENSUS OF MANUFACTURES

INDUSTRY SERIES

preliminary report

Cane sugar refining

SIC Code 2062

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Cane Sugar Refining Industry shipped products valued at $1,271 million, an increase of 27 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 18 percent from 1958 and 4 percent from 1962 to a total of 12.4 thousand employees in 1963. Value added by manufacture amounted to $255 million in 1963, an increase of 37 percent from 1958 and 9 percent from 1962.

The Cane Sugar Refining Industry includes establishments engaged primarily in the refining of raw cane sugar to produce granulated sugar, cube and tablet sugar, and other sugar products.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1963 but are not included for 1962 and earlier years.

Table 1.—GENERAL STATISTICS FOR THE CANE SUGAR REFINING INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2062)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]	Standard error of estimate (percent) for number of employees column[2]

(NA) Not available. (X) Not applicable.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2] The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3] Data for Alaska and Hawaii are not included.

[4] Includes 3 small establishments reporting the manufacture of liquid sugar.

[5] Value added by manufacture does not equal the published value of products shipped less the cost of material, etc., because an estimated value of production was used in the calculation in place of value of products shipped.

April 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949 and 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and 1939, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Cane Sugar Refining Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Cane Sugar Refining Industry amounted to $1,271 million. The industry shipments of primary products exceeded 95 percent of the total manufactured product shipments, primary and secondary. The exact percentage is withheld in order to avoid disclosing data for individual companies. The 1958 ratio was 100 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $1,255 million of refined cane sugar and byproducts were shipped by all producers of these products. Of this total, more than 95 percent was shipped by plants classified in Industry 2062, Cane Sugar Refining, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 100 percent.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.—GENERAL STATISTICS FOR THE CANE SUGAR REFINING INDUSTRY, BY GEOGRAPHIC AREAS: 1963 AND 1958

(SIC code 2062)

1963 CENSUS OF MANUFACTURES

MC63(P)-20F-3

INDUSTRY SERIES

preliminary report

Beet sugar SIC Code 2063

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Beet Sugar Industry shipped products valued at $564 million, an increase of 44 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 10 percent from 1958 and 4 percent from 1962 to a total to 11.4 thousand employees in 1963. Value added by manufacture amounted to $199 million in 1963, an increase of 52 percent from 1958 and 18 percent from 1962.

The Beet Sugar Industry includes establishments engaged primarily in the manufacture of granulated sugar, cube and tablet sugar, confectioners' powdered sugar, soft or brown sugar and liquid sugar or sugar sirup from sugar beets.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE BEET SUGAR INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2063)

(NA) Not available. (X) Not applicable.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

[4]For 1939, the figures cover the growing season beginning in 1939. For 1947 and later years, the figures generally cover the calendar year although some producers reported for the growing season beginning in the year covered by the survey.

[5]Value added by manufacture does not equal the published value of products shipped less cost of materials, etc., because estimated value of production was used in this calculation in place of value of products shipped.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Beet Sugar Industry consisted almost completely of products described above as primary to the industry, and a relatively small proportion for miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Beet Sugar Industry amounted to $564 million. Of this total all were for shipments of primary products except for $10 million of receipts for miscellaneous activities. The industry shipments of primary products therefore represented 100 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 100 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) differs from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $554 million of beet sugar were shipped by all producers of these products and all of such shipments were shipped by plants classified in Industry 2063, Beet Sugar. This was also the case in 1958.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these re-

ports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

INDUSTRY SERIES

preliminary report

Confectionery products and Chocolate and cocoa products

SIC Codes 2071 and 2072

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Confectionery Products Industry shipped products valued at $1,448 million, an increase of 13 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 4 percent from 1958 and 3 percent from 1962 to a total of 63.7 thousand employees in 1963. Value added by manufacture amounted to $634 million in 1963, an increase of 24 percent from 1958 and 5 percent from 1962.

During 1963, manufacturers in the Chocolate and Cocoa Products Industry shipped products valued at $479 million, an increase of 7 percent over 1958. Average employment in this industry showed an increase of 6 percent from 1958 and 1 percent from 1962 to a total of 8.8 thousand employees in 1963. Value added by manufacture amounted to $184 million in 1963, an increase of 36 percent from 1958 and 5 percent from 1962.

The Confectionery Products Industry includes establishments engaged primarily in the manufacture of candy, including chocolate candy made from purchased chocolate, salted nuts, other confectionery and related products. Establishments engaged primarily in manufacturing chewing gum are

(NA) Not available. (X) Not applicable.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

June 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

classified in Industry 2073. Establishments engaged primarily in manufacturing confectionery for direct sale on the premises and those engaged primarily in shelling and roasting nuts are classified in trade industries.

The Chocolate and Cocoa Products Industry includes establishments engaged primarily in shelling, roasting, and grinding of cocoa beans for the purpose of making chocolate liquor from which cocoa powder and cocoa butter are derived, and in the further manufacture of solid chocolate bars and chocolate coatings. Establishments engaged primarily in manufacturing products except candy from purchased chocolate and cocoa are classified in Industry 2099, Food Preparations, N.E.C., and chocolate candies in Industry 2071, Confectionery Products.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Confectionery Products Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Confectionery Products Industry amounted to $1,448 million. Of this total, $66 million were products primary to other industries; and $70 million were receipts for miscellaneous activities. The industry shipments of primary products represent 96 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 96 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $1,390 million of confectionery products (excluding chocolate made in chocolate plants) were shipped by all producers of these products. Of this total, $1,323 million, or 95 percent, were shipped by plants classified in Industry 2071, Confectionery Products, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 96 percent.

The total value of shipments and other receipts of establishments classified in the Chocolate and Cocoa Products Industry amounted to $479

illion. Of this total, $13 million were products rimary to other industries; and $3 million were eceipts for miscellaneous activities. The indus- ry shipments of primary products represent 97 ercent of the total manufactured product ship- ents, primary and secondary. The 1958 ratio was 8 percent.

The total value of shipments of chocolate and ocoa products made by all producers of these roducts was $563 million dollars as shown in able 3. Of this total, $463 million, or 82 per- ent, were shipped by plants classified in Industry 072, Chocolate and Cocoa Products, while the emainder was shipped by plants classified in ther industries. The 1958 ratio was 87 percent.

OMPARISON OF CENSUS AND CURRENT SURVEY DATA

The Census Bureau publishes monthly and annual hipments data for confectionery in Current In- ustrial Reports Series M20C, "Confectionery (In- luding Chocolate Products)."

The statistics presented in the Current In- ustrial Reports differ from those shown in table of this publication for a number of reasons. hese are:

1. The M20C data are estimates based on re- ports from approximately 343 large manu- facturers. Universe totals are obtained by benchmarking to a 1957 complete coverage survey of all confectionery manufacturers. To some extent, the 1957 inflation factors are outdated and will be revised based on the 1963 Census.

2. The current survey excludes the shipments of products (other than chocolate) in- cluded in census product class 20716, "Salted Nuts and Other Confectionery Prod- ucts."

3. While value of shipments, f.o.b. plant, is requested on both surveys, it was noted that some plants reported their shipments data monthly on a delivered basis and on an f.o.b. plant basis in the census.

4. There were some other reporting differ- ences for plants furnishing data in both surveys such as reporting on a fiscal year in the census.

The M20C summary for 1963 also includes a table showing product data. This information does not include data for manufacturer-retailers although such data are included in the census of manufac- tures product table.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1A, 1B, and 2 are reported for each estab- lishment as a whole. Aggregates of such figures for an industry reflect not only the primary ac- tivities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statis- tics (tables 1A, 1B, and 2) with product statis- tics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these re- ports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be con- ducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufac- turing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing estab- lishments in interim years.

Table 1B.—GENERAL STATISTICS FOR THE CHOCOLATE AND COCOA PRODUCTS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2072)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]	Standard error of estimate (percent) for number of employees column[2]

(NA) Not available. (X) Not applicable.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

Table 2.—GENERAL STATISTICS FOR THE CONFECTIONERY AND CHOCOLATE AND COCOA PRODUCTS INDUSTRIES BY GEOGRAPHIC AREAS: 1963 AND 1958

[1] Excludes confectionery-type chocolate made by chocolate manufacturers (see product class 20722) and chocolate coatings and other chocolate and cocoa products.

[2] The data for confectionery-type chocolate made from purchased chocolate are included in product classes 20716 and 20722.

[3] Quantity estimated based on the reported quantity-value relationship for other products of the product class or industry.

PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

PRELIMINARY REPORTS

Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories—durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

Area Series

Manufactures (51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3-digit industries, and for most individual counties on an "all manufacturing" basis.

Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

Manufactures

Volume I, Summary Statistics

Volume II, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39

Volume III, Area Statistics

Mineral Industries

Volume I, General Summary and Industry Statistics

Volume II, Area Statistics

1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

INDUSTRY SERIES

preliminary report

Chewing gum SIC Code 2073

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Chewing Gum Industry shipped products valued at $225 million, an increase of 22 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry was virtually unchanged from 1958 and amounted to 5.6 thousand employees in 1963. Value added by manufacture amounted to $136 million in 1963, an increase of 30 percent from 1958 and 5 percent from 1962.

The Chewing Gum Industry includes establishments engaged primarily in the manufacture of chewing gum or chewing gum base.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE CHEWING GUM INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2073)

(NA) Not available. (X) Not applicable. rRevised.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Chewing Gum Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Chewing Gum Industry amounted to $225 million. Of this total, $21 million were products primary to other industries; and $5 million were receipts for miscellaneous activities. The industry shipments of primary products represented 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 92 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $207 million of chewing gum and chewing gum base were shipped by all producers of these products. Of this total, $199 million, or 96 percent, were shipped by plants classified in Industry 2073, Chewing Gum, while the remainder was shipped by plants classified in other industries. The comparable ratio for 1958 was also 96 percent.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.--GENERAL STATISTICS FOR THE CHEWING GUM INDUSTRY BY GEOGRAPHIC AREAS: 1963 AND 1958

(SIC code 2073)

Geographic area	1963											1958

INDUSTRY SERIES

preliminary report

Malt liquors SIC Code 2082

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Malt Liquors Industry shipped products valued at $2,317 million, an increase of 17 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 13 percent from 1958 and 5 percent from 1962 to a total of 62.7 thousand employees in 1963. Value added by manufacture amounted to $1,287 million in 1963, an increase of 10 percent from 1958 and 1 percent from 1962.

The Malt Liquors Industry includes establishments engaged primarily in the manufacture of all kinds of malt liquors such as ale, beer, porter, stout, and malt extract.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

[4]Excludes establishments engaged in making "near beer." Data for 1939, for these establishments, were included in the figures for the "Bottled Soft Drinks" Industry.

BUREAU OF THE CENSUS, Richard M. Scammon, Director

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels from 1958 to 1963.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Malt Liquors Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Malt Liquors Industry amounted to $2,317 million. Of this total, $13 million were products primary to other industries; and $21 million were receipts for miscellaneous activities. The industry shipments of primary products represented 99 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 100 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $2,284 million of malt liquors and brewing byproducts were shipped by all producers of these products. Virtually all of this total were shipped by plants classified in Industry 2082, Malt Liquors, while the remainder was shipped by plants classified in other industries. This was also the case in 1958.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary

reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

1963 CENSUS OF MANUFACTURES

MC63(P)-20G-2

INDUSTRY SERIES

preliminary report

Malt SIC Code 2083

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Malt Industry shipped products valued at $180 million, a decrease of 8 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 20 percent from 1958 to a total of 1.9 thousand employees in 1963. Value added by manufacture amounted to $41 million in 1963, a decrease of 26 percent from 1958.

The Malt Industry includes establishments engaged primarily in the manufacture of barley, rye and wheat malt, and malt sprouts.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.--GENERAL STATISTICS FOR THE MALT INDUSTRY FOR SELECTED YEARS

(SIC code 2083)

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Malt Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Malt Industry amounted to $180 million. Of this total, $2 million were products primary to other industries; and $6 million were receipts for miscellaneous activities. The industry shipments of primary products represented 99 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 100 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $182 million of malt were shipped by all producers of these products. Of this total, $172 million, or 95 percent, were shipped by plants classified in Industry 2083, Malt, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 98.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries, and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, re-

pair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

1963 CENSUS OF MANUFACTURES

MC63(P)-20C-3

INDUSTRY SERIES

preliminary report

Wines and brandy

SIC Code 2084

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, value added by manufacture for establishments in the Wines and Brandy Industry was $137 million, an increase of 20 percent since 1958. Average employment in the industry showed an increase of 3 percent from 1958 to a total of 6.1 thousand employees in 1963.

The Wines and Brandy Industry includes establishments engaged primarily in the manufacture of wines, brandy, and brandy spirits. Bonded warehouses engaged in blending wines are also included in this industry. Establishments primarily bottling purchased wines, but which do not manufacture or blend wines or brandy, are classified in trade industries.

The value of shipments and cost of materials data for this industry contain a considerable amount of duplication which arises from the transfer of wines between establishments within the industry. Both finished and unfinished wines are shipped from wineries "in bond" to establishments which age, blend, clarify, bottle, or otherwise process the product, pay the Federal tax and ship the finished wine to dealers. The value of a given lot of wine may therefore be reported in the census

Table 1.—GENERAL STATISTICS FOR THE WINES AND BRANDY INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2084)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new [1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	222	70	6,111	35,051	4,137	8,403	20,521	136,568	[3]228,654	[3]367,463	7,310
1958	239	73	5,941	29,029	4,319	8,638	17,659	114,242	[3]160,358	[3]263,963	7,921

1939[4]	348	(NA)	(NA)	(NA)	2,337	(NA)	2,272	15,020	([3])	([3])	(NA)

(NA) Not available.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2] In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3] The value of products shipped and cost of materials contain extensive duplication, see text.

[4] Data for Alaska and Hawaii are not included.

May 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

by two or more establishments, first in bond and later as tax paid.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1947 and 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

As indicated above, the value of shipments for establishments in the Wines and Brandy Industry contains extensive duplication. Such shipments consist not only of products described as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Wines and Brandy Industry amounted to $367 million. Of this total, $6 million were products primary to other industries; and $14 million were receipts for miscellaneous activities. The industry shipments of primary products represent 98 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 98 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $352 million of wine and brandy products were shipped by all producers of these products. This total also includes duplication for the reasons mentioned earlier. Of this total, $348 million, or 99 percent, were shipped by plants classified in Industry 2084, Wines and Brandy, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 100 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

1963 CENSUS OF MANUFACTURES

MC63(P)-20G-4

INDUSTRY SERIES

preliminary report

Distilled liquor except brandy

SIC Code 2085

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Distilled Liquor, Except Brandy, Industry produced products valued at $1,077 million, an increase of 13 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 12 percent from 1958 to a total of 18 thousand employees in 1963. Value added by manufacture amounted to $613 million in 1963, an increase of 26 percent from 1958.

The Distilled Liquor, Except Brandy, Industry includes establishments engaged primarily in manufacturing liquors by distillation and rectification, and in manufacturing cordials and alcoholic cocktails by blending processes, or by mixing liquors and other ingredients.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date.

Table 1.—GENERAL STATISTICS FOR THE DISTILLED LIQUOR, EXCEPT BRANDY, INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2085)

(NA) Not available. rRevised.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of production (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of production for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of production which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF PRODUCTION

The value of production reported by establishments classified in the Distilled Liquor, Except Brandy, Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of production and other receipts of establishments classified in the Distilled Liquor, Except Brandy, Industry amounted to $1,077 million. Of this total, $17 million were products primary to other industries; and $116 million were receipts for miscellaneous activities. The industry's production of primary products represents 98 percent of the total manufactured products produced, primary and secondary. The 1958 ratio was 98 percent.

The total value of production for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $949 million of distilled liquor, except brandy, products were produced by all producers of these products. Of this total, $944 million, or 99 percent, were produced by plants classified in Industry 2085, Distilled Liquor, Except Brandy, while the remainder was produced by plants classified in other industries. The 1958 ratio was 98 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of production, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the production by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports

will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

INDUSTRY SERIES

preliminary report

Bottled and canned soft drinks

SIC Code 2086

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Bottled and Canned Soft Drinks Industry shipped products valued at $2,191 million, an increase of 41 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 10 percent from 1958 and 1 percent from 1962 to a total of 106.8 thousand employees in 1963. Value added by manufacture amounted to $1,214 million in 1963, an increase of 41 percent from 1958 and 8 percent from 1962.

The Bottled and Canned Soft Drinks Industry includes establishments engaged primarily in the manufacture of bottled or canned soft drinks (nonalcoholic beverages) and carbonated waters. Establishments primarily engaged in bottling natural spring waters are classified in trade industries.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

(NA) Not available. (X) Not applicable. r Revised.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2] The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3] Data for Alaska and Hawaii are not included.

[4] Includes data for establishments primarily engaged in making "near beer." These establishments, for the years 1947-1963, are included in the Malt Liquor Industry, SIC 2082.

May 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period. The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Bottled and Canned Soft Drinks Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Bottled and Canned Soft Drinks Industry amounted to $2,191 million. Of this total, $41 million were products primary to other industries; and $130 million were receipts for miscellaneous activities. The industry shipments of primary products represent 98 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 98 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $2,128 million of bottled and canned soft drinks products were shipped by all producers of these products. Of this total, $2,019 million, or 95 percent, were shipped by plants classified in Industry 2086, Bottled and Canned Soft Drinks, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 98 percent.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (tables 3A and 3B) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment" and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any

J.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Note: Each producing State not shown separately in the above table was withheld either (a) to avoid disclosing figures for individual companies, in this or associated industries or areas, or (b) because the industry was of relatively minor economic importance in the State. (Additional publishable detail will appear in the final census report on this industry.)

[1]Less than $500 thousand.

Table 3A.--QUANTITY AND VALUE OF SOFT DRINKS AND CARBONATED WATERS SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958

(Includes quantity and value of these products reported not only by establishments classified in the Bottled and Canned Soft Drinks Industry but also by establishments making these items as "secondary" products in other industries. See text under "Value of Shipments")

[r] Revised.

[1] Includes an estimate for the number of cases of soft drinks sold in bulk by assuming 1.5 gallons equals one case.

[2] The data for carbonated soft drinks are summary information. More detailed data by bottle sizes are shown in table 3B.

[3] Includes all nondietetic flavored drinks reported in the "All other bottle size" category in table 3B.

[4] Includes fruit drinks distributed in glass, paperboard containers, and cans by dairies and canneries; excludes a substantial quantity packed on commission from materials owned by others. While data for the production of fruit drinks on commission are not available, the commission receipts for canning fruit drinks in 1963 amounted to $3,481 thousand.

[5] Quantity estimated based on the quantity-value relationship reported for other products.

Table 3B.—QUANTITY AND VALUE OF BOTTLED CARBONATED SOFT DRINKS BY BOTTLE SIZE SHIPPED BY ALL PRODUCERS IN THE UNITED STATES: 1963 AND 1958

Product code	Product	Total shipments including interplant transfers			
		1963		1958	
		Quantity (1,000 cases)	Value ($1,000)	Quantity (1,000 cases)	Value ($1,000)

20860 37	Carbonated water and club soda	9,030	15,713	9,785	16,026
20860 38	Other carbonated flavors	22,119	36,134	14,346	21,485
20860 39	Dietetics, all flavors	5,430	8,060		
20860 40	Flavor not specified[1]	6,391	7,077	4,716	6,568
	Bottled carbonated soft drinks, all other sizes	[2]6,116	8,856	r [2]2,513	2,869
20860 51	Nondietetics	[2]5,095	7,378	r [2]2,513	2,869
20860 53	Dietetics	[2]1,021	1,478		

Note: The 1963 classifications by bottle size were revised from those used in 1958. Therefore, the 1963 and 1958 data are not comparable. In the table above, the 1963 data are for the indicated bottle sizes. The 1958 data relate to the bottle sizes shown below:

1963 bottle sizes	1958 bottle sizes
6 to 9 ounce	6 and 7 ounce
10 and 12 ounce	8, 9, and 10 ounce
16 ounce	12 and 16 ounce
24-32 ounce	20-32 ounce
all other sizes	larger than 32 ounce

The data for both 1958 and 1963 exclude soft drinks and fruit drinks and ades not specified by kind. The value of such drinks were $121 million in 1958 and $120 million in 1963.

r Revised.

[1] Represents data reported by small bottlers who were not requested to differentiate between dietetic or nondietetic or by flavor.

[2] In both 1963 and 1958, although respondents were asked to report quantity data in gallons, a large number reported in cases. Therefore, for these products quantities, in cases, have been estimated based on the quantity-value relationship reported for other products.

PUBLICATION PROGRAM 1963 CENSUSES OF MANUFACTURES AND MINERAL INDUSTRIES

Results of the 1963 Censuses of Manufactures and Mineral Industries will be issued initially in preliminary reports which will furnish summary data. These reports will be superseded by more detailed final reports. An outline of the publication program is shown below.

PRELIMINARY REPORTS

Summary Series

Manufactures (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. General statistics will also be presented for industries grouped according to market categories—durable and nondurable goods industries. A second report will provide general statistics without industry detail for regions, States, and large standard metropolitan statistical areas.

Mineral Industries (2 reports). One report will present general statistics at the U.S. level for each 4-digit industry and 2- and 3-digit industry group. A second report will provide general statistics by 2-digit industry group for regions and States.

Industry Series

Manufactures (about 370 reports). Separate reports for virtually all of the 430 manufacturing industries will give industry totals for general statistics for the United States and for regions and States. A product table in each report will give the quantity and value of shipments of the products classified in the industry for the United States.

Mineral Industries (about 45 reports). Separate reports for industries or for groups of industries for all of the 50 mineral industries will present general statistics for the United States and for regions and States. A product table will give the quantity and value of shipments of the products classified in the industry for the United States and for regions and States.

Area Series

Manufactures (51 reports). A separate report for each State and the District of Columbia will present general statistics for the State and for the larger standard metropolitan statistical areas within the State by 2-digit and selected 3-digit industries, and for most individual counties on an "all manufacturing" basis.

Subject Series

Manufactures (2 reports). One report will provide data on the number of establishments, employment, and value added by manufacturing for each 4-digit industry according to employment size of the establishment in each industry. A separate report will provide statistics on inventories for each 4-digit industry on a national basis; State data on inventories will also be provided.

Mineral Industries (one report). This report will provide number of establishments, employment, and value added in mining for each 4-digit industry according to employment size of the establishment in each industry.

FINAL REPORTS

All preliminary reports will be superseded by comparable final reports. After separate final reports have been issued, they will be assembled and reissued in cloth bindings as follows:

Manufactures

Volume I, Summary Statistics

Volume II, Industry Statistics
Part 1, Major Groups 20-28
Part 2, Major Groups 29-39

Volume III, Area Statistics

Mineral Industries

Volume I, General Summary and Industry Statistics

Volume II, Area Statistics

1963 CENSUS OF MANUFACTURES IN PUERTO RICO

A separate 1963 Census of Manufactures was conducted jointly by the Puerto Rico Planning Board, Government of the Commonwealth of Puerto Rico, and the U.S. Bureau of the Census. A report of the findings will include statistics of manufacturing activity by industry and geographic area on value added by manufacture, employment, payrolls, inventories, capital expenditures, etc.

Additional Information and Order Forms

A more detailed description of the publication program of the 1963 censuses, including tentative publication dates, is available free of charge. Separate announcement and order forms for the preliminary reports of the censuses of manufactures and mineral industries are also available free of charge. Requests for order forms should specify which report series is desired. All requests should be addressed to the Publications Distribution Section, Bureau of the Census, Washington, D.C., 20233.

1963 CENSUS OF MANUFACTURES

MC63(P)-20G-5

INDUSTRY SERIES

Flavorings SIC Code 2087

preliminary report

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Flavorings Industry shipped products valued at $720 million, an increase of 51 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 3 percent from 1958 to a total of 9.0 thousand employees in 1963. Value added by manufacture amounted to $394 million in 1963, an increase of 58 percent from 1958.

The Flavorings Industry includes establishments engaged primarily in the manufacture of flavoring extracts, sirups for soda fountain use or for the manufacture of soft drinks, food colorings and concentrated fruit juice products (not frozen).

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.—GENERAL STATISTICS FOR THE FLAVORINGS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2087)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	518	96	9,021	56,148	4,943	10,150	24,883	393,611	331,158	720,100	12,199
1958	531	95	9,307	47,532	5,264	10,335	22,029	249,442	224,882	477,052	5,375
1954[3]	558	109	10,593	45,060	6,543	12,402	20,308	221,756	238,050	459,433	6,642
1947[3]	606	122	11,726	37,149	7,242	14,626	17,720	158,333	155,240	313,573	(NA)
1939[3]	477	(NA)	6,950	12,300	3,589	(NA)	3,764	89,734	50,168	139,902	(NA)

(NA) Not available.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

March 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Flavorings Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Flavorings Industry amounted to $720 million. Of this total, $65 million were products primary to other industries; and $35 million were receipts for miscellaneous activities. The industry shipments of primary products represented 91 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 90 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $766 million of flavoring extracts and flavoring sirups were shipped by all producers of these products. Of this total, $620 million, or 81 percent, were shipped by plants classified in Industry 2087, Flavorings, while the remainder was shipped by plants classified in other industries. The comparable percent for 1958 was 83.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports

will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.—GENERAL STATISTICS FOR THE FLAVORINGS INDUSTRY BY GEOGRAPHIC AREAS: 1963 AND 1958

(SIC code 2087)

Geographic area	1963											1958	
	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new	All employees, number	Value added by manufacture
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)		($1,000)

1963 CENSUS OF MANUFACTURES

MC63(P)-20H-1

INDUSTRY SERIES

preliminary report

Cottonseed oil mills SIC Code 2091

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in Cottonseed Oil Mills shipped products valued at $555 million, an increase of 32 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of less than one percent from 1958 to a total of 8.4 thousand employees in 1963. Value added by manufacture amounted to $103 million in 1963, an increase of 62 percent from 1958.

Cottonseed Oil Mills include establishments engaged primarily in manufacturing cottonseed oil, and byproduct cake, meal, and linters. Establishments primarily engaged in refining cottonseed oil into edible cooking oils are classified in Industry 2096, Shortening and Cooking Oils.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date.

Table 1.--GENERAL STATISTICS FOR COTTONSEED OIL MILLS IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2091)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	188	153	8,372	38,173	6,552	16,556	25,881	103,213	462,266	555,188	12,475
1958	214	163	8,355	31,223	6,310	14,899	20,006	63,587	348,580	420,649	6,605
1954[3]	286	144	13,665	43,103	11,082	27,080	29,831	111,734	487,726	592,298	11,680
1947[3]	315	262	14,398	31,419	12,136	30,996	22,560	104,603	413,488	518,091	9,804
1939[3]	447	(NA)	18,519	14,881	15,191	(NA)	8,939	32,712	138,764	171,476	(NA)

(NA) Not available.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

May 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified as Cottonseed Oil Mills consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified as Cottonseed Oil Mills amounted to $555 million. Of this total, $51 million were products primary to other industries; and $60 million were receipts for miscellaneous activities. The industry shipments of primary products represent 90 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 92 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $481 million of cottonseed oil mills products were shipped by all producers of these products. Of this total, $445 million, or 93 percent, were shipped by plants classified in Industry 2091, Cottonseed Oil Mills, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 92 percent.

COMPARISON OF CENSUS AND CURRENT SURVEY DATA

Production data for the products of this industry have been published in Current Industrial Reports Series M20J, "Fats and Oils--Vegetable Oil Crushers," and M20K, "Fats and Oils--Production, Consumption, and Factory and Warehouse Stocks," Summaries for 1963.

Figures for the various product categories differ somewhat in the current surveys and the census of manufactures. These are primarily due to reporting differences. The current survey data are collected monthly and cumulated to a calendar year's total. Many companies, however, reported in the census of manufactures on a fiscal year basis which resulted in some variation in the data.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

1963 CENSUS OF MANUFACTURES

MC63(P)-20H-2

INDUSTRY SERIES

preliminary report

Soybean oil mills

SIC Code 2092

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in Soybean Oil Mills shipped products valued at $1,464 million, an increase of 36 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 20 percent from 1958 and 11 percent from 1962 to a total of 6.5 thousand employees in 1963. Value added by manufacture amounted to $149 million in 1963, an increase of 5 percent from 1958 and 1 percent from 1962.

Soybean Oil Mills include establishments engaged primarily in the manufacture of soybean oil, and byproduct cake and meal. Establishments primarily engaged in refining soybean oil into edible cooking oils are classified in Industry 2096, Shortening and Cooking Oils.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date.

(NA) Not available. (X) Not applicable. rRevised.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]The data are estimates derived from a representative sample of manufacturing establishments canvassed in the Annual Survey of Manufactures. These estimates, consequently, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The percentage standard errors in this column indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. See the Annual Survey of Manufactures volumes for further discussion of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

May 1965

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1945-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified as Soybean Oil Mills consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified as Soybean Oil Mills amounted to $1,464 million. Of this total, $156 million were products primary to other industries; and $95 million were receipts for miscellaneous activities. The industry shipments of primary products represent 89 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 87 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $1,305 million of soybean oil mills products were shipped by all producers of these products. Of this total, $1,213 million, or 93 percent, were shipped by plants classified in Industry 2092, Soybean Oil Mills, while the remainder was shipped by plants classified in other industries. The comparable ratio in 1958 was 94.

COMPARISON OF CENSUS AND CURRENT SURVEY DATA

Production data for the products of this industry have been published in Current Industrial Reports Series M20J, "Fats and Oils—Vegetable Oil Crushers," and M20K, "Fats and Oils—Production, Consumption, and Factory and Warehouse Stocks," Summaries for 1963.

Figures for the various product categories differ somewhat in the current surveys and the census of manufactures. These are primarily due to reporting differences. The current survey data are collected monthly and cumulated to a calendar year's total. Many companies, however, reported in the census of manufactures on a fiscal year basis which resulted in some variation in the data.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

INDUSTRY SERIES

preliminary report

Vegetable oil mills, n. e. c.

SIC Code 2093

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Vegetable Oil Mills, N.E.C., Industry shipped products valued at $263 million, a decrease of 16 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 4 percent from 1958 to a total of 2.2 thousand employees in 1963. Value added by manufacture amounted to $45 million in 1963, an increase of 7 percent from 1958.

The Vegetable Oil Mills, N.E.C., Industry includes establishments engaged primarily in manufacturing vegetable oils and byproduct cake and meal, except cottonseed and soybean. Establishments primarily engaged in refining vegetable oils into edible cooking oils are classified in Industry 2096, Shortening and Cooking Oils, and those refining these oils for medicinal purposes in Industry 2833, Medicinals and Botanicals.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

Table 1.—GENERAL STATISTICS FOR THE VEGETABLE OIL MILLS, N.E.C., INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2093)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	48	23	2,162	12,643	1,667	3,527	8,921	45,036	219,194	263,269	2,294
1958	46	20	2,252	12,525	1,794	3,861	9,544	42,066	270,651	314,695	2,032

1939[3]	63	(NA)	(NA)	(NA)	2,980	(NA)	4,092	15,237	71,997	87,234	(NA)

(NA) Not available.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]Data for Alaska and Hawaii are not included.

June 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Vegetable Oil Mills, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Vegetable Oil Mills, N.E.C., Industry amounted to $263 million. Of this total, $33 million were products primary to other industries; and $41 million were receipts for miscellaneous activities. The industry shipments of primary products represent 72 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 80 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $190 million of vegetable oil mill products, n.e.c., were shipped by all producers of these products. Of this total, $157 million, or 83 percent, were shipped by plants classified in Industry 2093, Vegetable Oil Mills, N.E.C., while the remainder was shipped by plants classified in other industries. The 1958 ratio was 93 percent.

COMPARISION OF CENSUS AND CURRENT SURVEY DATA

Production data for the products of this industry have been published in Current Industrial Reports Series M20J, "Fats and Oils-Vegetable Oil Crushers," and M20K, "Fats and Oils-Production, Consumption, and Factory and Warehouse Stocks," Summaries for 1963.

Figures for the various product categories differ somewhat in the current surveys and the census of manufactures. These are primarily due to reporting differences. The current survey data are collected monthly and cumulated to a calendar year's total. Many companies, however, reported in the census of manufactures on a fiscal year basis which resulted in some variation in the data.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which

show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.—GENERAL STATISTICS FOR THE VEGETABLE OIL MILLS, N.E.C., INDUSTRY BY GEOGRAPHIC AREAS: 1963 AND 1958

(SIC code 2093)

Geographic area	1963											1958	
	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new	All employees, number	Value added by manufacture

1963 CENSUS OF MANUFACTURES

MC63(P)-20H-4

INDUSTRY SERIES

preliminary report

Animal and marine fats and oils

SIC Code 2094

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Animal and Marine Fats and Oils Industry shipped products valued at $467.3 million, an increase of 20 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 5 percent from 1958 to a total of 14.0 thousand employees in 1963. Value added by manufacture amounted to $196.8 million in 1963, an increase of 30 percent from 1958.

The Animal and Marine Fats and Oils Industry includes establishments engaged primarily in rendering inedible tallow and grease from animal fat, bones, and meat scraps or in manufacturing other animal oils including fish oil, other marine animal oils and byproduct meal.

Prior to 1963, establishments in this industry were included in two industries: 2094 (grease and tallow) and 2095 (animal and marine fats and oils, except grease and tallow). The general statistics for years prior to 1963 have been revised to include both old SIC codes 2094 and 2095 in order to obtain data comparable to 1963.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing

Table 1.--GENERAL STATISTICS FOR THE ANIMAL AND MARINE FATS AND OILS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2094)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	610	203	14,045	77,567	10,072	22,517	50,775	196,766	270,293	467,298	13,424
1958[3]	617	210	14,575	67,869	10,908	23,628	46,373	151,595	238,452	389,298	12,745
1954[3] [4]	561	181	13,760	55,063	10,369	23,951	37,573	118,438	186,495	304,171	12,682

1939[3] [4]	396	(NA)	(NA)	(NA)	6,868	(NA)	8,002	26,511	52,623	79,134	(NA)

(NA) Not available.

[1]Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2]In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1963 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3]Revised to include old SIC codes 2094 (Grease and tallow) and 2095 (Animal and marine fats and oils, except grease and tallow).

[4]Data for Alaska and Hawaii are not included.

April 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Animal and Marine Fats and Oils Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Animal and Marine Fats and Oils Industry amounted to $467.3 million. Of this total, $33.7 million were products primary to other industries; and $19.7 million were receipts for miscellaneous activities. The industry shipments of primary products represented 93 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was also 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $619.9 million of animal and marine fats and oils and related products were shipped by all producers of these products. Of this total, $413.9 million, or 67 percent, were shipped by plants classified in Industry 2094, Animal and Marine Fats and Oils, while the remainder was shipped by plants classified in other industries.

COMPARISON OF CENSUS AND CURRENT SURVEY DATA

Establishments producing grease and inedible tallow also report their production monthly. The data are published in Current Industrial Reports Series M20K, Fats and Oils - Production, Consumption, and Factory and Warehouse Stocks.

For 1963, the Census of Manufactures shows the production of 4,156.5 million pounds of grease and inedible tallow in comparison with the 3,806.3 million pounds as published in the Current Industrial Report M20K Summary for 1963. Most of the difference is due to the omission of plants from the monthly fats and oils surveys.

It is expected that the complete list of producers of inedible tallow and grease from the Census of Manufactures will be available in the near future and will be used as a basis for revisions to the data published in Current Industrial Reports Series M20K.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

(X) Not applicable.

[1]Edible tallow will be shown in the report for Industry 2011, Meat Packing. See text for "Comparison of Census and Current Survey Data."

[2]The data for these products have been combined because of reporting difficulties. There is also a substantial but unknown amount of duplication in these figures. They include not only the shipments of the primary producers (renderers), but also shipments reported by processors and blenders that purchase meat meal and tankage, process it, and sell it as meat meal and tankage.

[3]Estimated based on the average quantity-value relationship of other products of the industry.

[4]For 1958, this represented grease, inedible tallow, and feed and fertilizer byproducts not specified by kind.

1963 CENSUS OF MANUFACTURES

MC63(P)-20H-5

INDUSTRY SERIES

preliminary report

Shortening and cooking oils

SIC Code 2096

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Shortening and Cooking Oils Industry shipped products valued at $1,292 million, an increase of 4 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 7 percent from 1958 to a total of 13.3 thousand employees in 1963. Value added by manufacture amounted to $257 million in 1963, an increase of 16 percent from 1958.

The Shortening and Cooking Oils Industry includes establishments engaged primarily in the manufacture of shortening, table oils, margarine, and other edible fats and oils, n.e.c., by further processing of animal and vegetable oils. Establishments primarily engaged in producing corn oil are classified in Industry 2046, Wet Corn Milling.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and subsequent

Table 1.--GENERAL STATISTICS FOR THE SHORTENING AND COOKING OILS INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2096)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new [1]

1939	100	(NA)	(NA)	(NA)	5,897	(NA)	6,933	45,498	180,477	225,975	(NA)

(NA) Not available.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2] In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3] Data for Alaska and Hawaii are not included.

June 1965

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958, and 1963, value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Shortening and Cooking Oils Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Shortening and Cooking Oils Industry amounted to $1,292 million. Of this total, $131 million were products primary to other industries; and $76 million were receipts for miscellaneous activities. The industry shipments of primary products represent 89 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 93 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $1,230 million of shortening and cooking oils were shipped by all producers of these products. Of this total, $1,085 million, or 88 percent, were shipped by plants classified in Industry 2096, Shortening and Cooking Oils, while the remainder was shipped by plants classified in other industries. The 1958 ratio was 90 percent.

COMPARISON OF CENSUS AND CURRENT SURVEY DATA

Production data for the products of this industry have been published in Current Industrial Reports Series M20J, "Fats and Oils--Vegetable Oil Crushers," and M20K, "Fats and Oils--Production, Consumption, and Factory and Warehouse Stocks," Summaries for 1963.

Figures for the various product categories differ somewhat in the current surveys and the census of manufactures. These are primarily due to reporting differences for establishments reporting in both surveys. The current survey data are collected monthly and cumulated to a calendar year's total. Many companies, however, reported in the census of manufactures on a fiscal year basis which resulted in some variation in the data.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities

(contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

1963 CENSUS OF MANUFACTURES

MC63(P)-20-1

INDUSTRY SERIES

preliminary report

Roasted coffee SIC Code 2095

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Roasted Coffee Industry shipped products valued at $1,846 million, a decrease of 9 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 11 percent from 1958 to a total of 16.8 thousand employees in 1963. Value added by manufacture amounted to $608 million in 1963, an increase of 32 percent from 1958.

The Roasted Coffee Industry includes establishments engaged primarily in the manufacture of roasted and concentrated coffee. The roasted coffee may be whole bean or ground. The concentrated coffee is produced in liquid or powdered form.

The 1957 Standard Industrial Classification (SIC) Manual was amended prior to the 1963 Census of Manufactures to separately define the Roasted and Concentrated Coffee Industry. In previous censuses, establishments primarily producing roasted or concentrated coffee were classified in Industry 2099, Food Preparations, N.E.C.

For both the 1958 and 1954 Censuses of Manufactures, shipments of roasted and concentrated

(NA) Not available.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available for this industry for 1954 and 1958.

[2] Data for Alaska and Hawaii are not included.

[3] Prior to 1963, coffee roasting was not classified as a separate industry (see text).

March 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

coffee were collected as a separate product class and general statistics (employment, payroll, shipments, etc.) were tabulated for those plants classified in Industry 2099 that were primarily producing coffee. These data were previously published in table 8 of the respective final census reports and are shown in table 1 of this report.

The detailed table 8 data understate the industry totals primarily because a number of relatively small plants did not report sufficient product information to enable proper classification by principal product class. This understatement would not have a significant effect on the data (other than establishment counts) for the coffee industry. The effect on the establishment count is not known.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. Data for Alaska and Hawaii are included for 1956 but are not included for earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. The figures for production workers, 1954-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

VALUE ADDED BY MANUFACTURE

For 1958 and 1963, value added by manufacture represents adjusted value added; for 1954 it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Roasted Coffee Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Roasted Coffee Industry amounted to $1,846 million. Of this total, $215 million were products primary to other industries; and $136 million were receipts for miscellaneous activities. The industry shipments of primary products represented 87 percent of the total manufactured product shipments, primary and secondary.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $1,588 million of roasted and concentrated coffee were shipped by all producers of these products. Of this total, $1,495 million, or 94 percent, were shipped by plants classified in Industry 2095, Roasted Coffee, while the remainder was shipped by plants classified in other industries.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3A) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

1963 CENSUS OF MANUFACTURES

MC63(P)-20I-2

INDUSTRY SERIES

preliminary report

Manufactured ice SIC Code 2097

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Manufactured Ice Industry shipped products valued at $121.8 million, a decrease of 19 percent from 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed a decrease of 26 percent from 1958 to a total of 10.7 thousand employees in 1963. Value added by manufacture amounted to $89.6 million in 1963, a decrease of 17 percent from 1958.

The Manufactured Ice Industry includes establishments engaged primarily in the manufacture of ice for sale. Ice plants operated by public utility companies are included in this industry. Establishments primarily engaged in manufacturing dry ice are classified in Industry 2813 and the harvesting and storage of natural ice for sale in trade industries.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska

and Hawaii are included for 1958 and subsequent years but are not included for 1954 and earlier years.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954, 1958 and 1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Manufactured Ice Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Manufactured Ice Industry amounted to $121.8 million. Of this total, $1.0 million were products primary to other industries; and $27.2 million were receipts for miscellaneous activities. The industry shipments of primary products represented 99 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio also was 99 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $94.3 million of manufactured ice were shipped by all producers of these products. Of this total, $93.9 million, or 99 percent, were shipped by plants classified in Industry 2097, Manufactured Ice, while the remainder was shipped by plants classified in other industries. The comparable percentage in 1958 was 99. Shipments of canned or block ice decreased 35 percent from 10,043 thousand tons in 1958 to 6,556 thousand tons in 1963. Cubed, crushed, or other processed ice decreased 18 percent from 1,223 thousand tons to 1,001 thousand tons in 1963.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965

through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

1963 CENSUS OF MANUFACTURES

MC63(P)-201-3

INDUSTRY SERIES

preliminary report

Macaroni and spaghetti

SIC Code 2098

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Macaroni and Spaghetti Industry shipped products valued at $223 million, an increase of 24 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 7 percent from 1958 to a total of 7.3 thousand employees in 1963. Value added by manufacture amounted to $96 million in 1963, an increase of 45 percent from 1958.

The Macaroni and Spaghetti Industry includes establishments engaged primarily in the manufacture of dry macaroni, spaghetti, vermicelli and noodles. Establishments primarily engaged in manufacturing canned macaroni, spaghetti, etc., are classified in Industry 2032.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and 1963 but are not included for earlier years.

Table 1.—GENERAL STATISTICS FOR THE MACARONI AND SPAGHETTI INDUSTRY IN THE UNITED STATES FOR SELECTED YEARS

(SIC code 2098)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]

1939[3]	328	(NA)	8,140	9,351	6,013	(NA)	5,383	19,224	26,929	46,153	(NA)

(NA) Not available.

[1] Includes expenditures for plants under construction but not in operation. This information was not collected in 1939 and 1947 and is not available by 4-digit industry for 1954.

[2] In addition to the data shown, estimates have been derived and generally published for 1959-1962 from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, consequently, may differ from the results that would be obtained from a complete canvass of all manufacturing establishments. The percentage standard errors indicate the range of differences that can be expected between the estimates and complete canvass totals because of sampling fluctuations. For this industry, the standard errors were relatively high. Therefore, the 1959-1962 data have been withheld from this preliminary report. It is planned, however, to publish such information in the final census reports. See annual survey of manufactures volumes for further explanation of the sampling estimate.

[3] Data for Alaska and Hawaii are not included.

February 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

The method of compiling figures for employees has varied somewhat from period to period. For the period 1955-1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March; for 1949-1954, they represent an average of all employees for the payroll period ended nearest the 15th of March, May, August, and November. For 1947, the all employee figure is an average of 12 monthly figures. For 1939 and prior years, all employees represents the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). The figures for production workers, 1949-1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November. For 1947 and prior years, the figure represents the average of 12 monthly figures.

VALUE ADDED BY MANUFACTURE

For 1954 and 1958-1963 value added by manufacture represents adjusted value added; for earlier years it represents unadjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year. Unadjusted value added is obtained by subtracting the cost of materials, supplies, and containers, fuel, purchased electric energy and contract work from the value of shipments for products manufactured plus receipts for services rendered.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in the Macaroni and Spaghetti Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Macaroni and Spaghetti Industry amounted to $223 million. Of this total, $11 million were products primary to other industries; and $11 million were receipts for miscellaneous activities. The industry shipments of primary products represented 95 percent of the total manufactured product shipments, primary and secondary. The 1958 ratio was 97 percent.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3A, indicates that $205 million of macaroni and spaghetti were shipped by all producers of these products. Of this total, $202 million, or 99 percent, were shipped by plants classified in Industry 2098, Macaroni and Spaghetti, while the remainder was shipped by plants classified in other industries. In 1958 the comparable ratio was 98.

INDEXES OF PRODUCTION AND UNIT VALUE

Based on the type of quantity and value statistics shown in table 3A, indexes of production and unit value (value of shipments divided by quantity of shipments) have been constructed for the primary products of the industry produced or shipped by all producers, including those in other industries and are shown in table 3B. Unit values were computed for each product for which quantity figures were available. The 1958 unit values were used as weights in construction of a weighted aggregative production index. A comparable weighted aggregative unit value index, weighted by quantity of production or shipments, was also constructed. The latter index was used, where necessary, to deflate total value of shipments of primary products for which no quantity data were available.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports

will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in 1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.

Table 2.—GENERAL STATISTICS FOR THE MACARONI AND SPAGHETTI INDUSTRY BY REGIONS AND STATES: 1963 AND 1958

(SIC code 2098)

Region and State	1963											1958	
	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new	All employees, number	Value added by manufacture

1963 CENSUS OF MANUFACTURES

MC63(P)-2014

INDUSTRY SERIES

preliminary report

Food preparations, n.e.c.

SIC Code 2099

This report is one of a series presenting preliminary information on industries and products covered in the 1963 Census of Manufactures. The data will be superseded in a final report which, in turn, will be included in Volume II, Industry Statistics, 1963 Census of Manufactures.

During 1963, manufacturers in the Food Preparations, N.E.C., Industry shipped products valued at $1,786 million, an increase of 28 percent over 1958, according to preliminary results obtained from the 1963 census. Average employment in this industry showed an increase of 10 percent from 1958 to a total of 54 thousand employees in 1963. Value added by manufacture amounted to $843 million in 1963, an increase of 39 percent from 1958.

The Food Preparations, N.E.C., Industry includes establishments engaged primarily in manufacturing prepared foods and miscellaneous specialties, n.e.c., such as baking powder, yeast, and other leavening compounds; desserts (ready-to-mix); sweetening sirups and molasses; vinegar and cider; chocolate and cocoa products, except confectionery, made from purchased chocolate; potato and corn chips, sticks, etc. (bagged or canned); and other food preparations not elsewhere classified.

Prior to 1963, this industry included establishments engaged primarily in the production of roasted or concentrated coffee. However, for 1963, this activity was defined as a separate industry, Standard Industrial Classification 2095, Roasted

Table 1.—GENERAL STATISTICS FOR THE FOOD PREPARATIONS, N.E.C., INDUSTRY IN THE UNITED STATES: 1963 AND 1958

(SIC code 2099)

Year	Establishments (number)		All employees		Production workers			Value added by manufacture	Cost of materials	Value of shipments	Capital expenditures, new[1]
	Total	With 20 or more employees	Number	Payroll ($1,000)	Number	Man-hours (1,000)	Wages ($1,000)	($1,000)	($1,000)	($1,000)	($1,000)
1963[2]	2,187	551	54,008	269,515	35,460	70,844	143,955	842,849	949,315	1,786,005	39,892
1958[2 3]	2,307	(NA)	49,169	205,919	34,495	67,544	117,745	604,722	797,385	1,393,174	31,121

(NA) Not available.

[1]Includes expenditures for plants under construction but not in operation.

[2]Prior to 1963, this industry included data for coffee roasting establishments; however, in the 1963 Census of Manufactures, coffee roasting was defined as a separate industry, Standard Industrial Classification 2095. The 1958 data have been revised to exclude establishments primarily roasting coffee (see text).

[3]Data for years prior to 1958 are not comparable to the information shown for 1963 and 1958. However, in the 1958 Census of Manufactures report, there is shown information for the Census years 1947-1958 on a comparable basis.

August 1965

U.S. DEPARTMENT OF COMMERCE, John T. Connor, Secretary

BUREAU OF THE CENSUS, A. Ross Eckler, Director

For sale by the Bureau of the Census, Washington, D.C., 20233, and U.S. Department of Commerce Field Offices. 10 cents.

Coffee. The 1958 data for the Food Preparations, N.E.C., Industry was therefore revised to exclude the coffee roasting establishments.

This report does not include figures for administrative offices, warehouses, garages, or other auxiliary units which service manufacturing establishments. The classification of establishments for which data are tabulated in this report is based upon the definitions embodied in the 1957 edition of the Standard Industrial Classification (SIC) Manual, as amended to date. Data for Alaska and Hawaii are included for 1958 and 1963.

ESTABLISHMENTS

The census of manufactures is conducted by obtaining a separate report for each establishment in the United States; however, manufacturing establishments with no employees are excluded from the census. Of almost 310,000 manufacturing establishments included in the 1963 census, most are operated as single-establishment companies and file a single report. Firms operating more than one establishment were required to submit a report for each separate location. Companies engaged in distinctly different lines of activity at one location were asked to submit separate reports if the company records permitted such a separation, and if the separate activities were substantial in size.

EMPLOYEES

For the years 1958 and 1963, figures on all employees represent the average number of production workers for the payroll periods ended nearest the 15th of March, May, August, and November, plus the number of all other employees for the payroll period ended nearest the 15th of March. The figures for production workers, 1958 and 1963, are based on employment for the payroll period ended nearest the 15th of March, May, August, and November.

VALUE ADDED BY MANUFACTURE

For 1958 and 1963, value added by manufacture represents adjusted value added. Adjusted value added is equal to the value of shipments (including resales of finished products) less the cost of finished products resold, materials, supplies, fuels, electric energy, and contract work, plus the net change in the value of finished products and work-in-process inventories between the beginning and end of the year.

Value added avoids the duplication in the value of shipments which results from the use of products of some manufacturing establishments as materials by other manufacturing establishments and is, for most purposes, the best value measure available for comparing the relative economic importance of manufacturing industries or geographic areas. No adjustments have been made in the money figures shown in this report for changes in price levels.

VALUE OF SHIPMENTS

The value of shipments reported by establishments classified in Food Preparations, N.E.C., Industry consists not only of products described above as primary to the industry, but also of the value of secondary products (which are primary in other industries), and miscellaneous receipts for contract work, resale of products, etc. The total value of shipments and other receipts of establishments classified in the Food Preparations, N.E.C., Industry amounted to $1,786 million. Of this total, $153 million were products primary to other industries; and $116 million were receipts for miscellaneous activities. The industry shipments of primary products represent 91 percent of the total manufactured product shipments, primary and secondary.

The total value of shipments for the industry (i.e., the total value of receipts of establishments classified in the industry) should be clearly distinguished from the total value of primary products of the industry shipped by all producers. The latter figure, appearing in table 3, indicates that $1,962 million of food preparations, n.e.c., were shipped by all producers of these products. Of this total, $1,517 million, or 77 percent, were shipped by plants classified in Industry 2099, Food Preparations, N.E.C., while the remainder was shipped by plants classified in other industries.

GENERAL STATISTICS

The general statistics (employment, payrolls, cost of materials, value of shipments, etc.) in tables 1 and 2 are reported for each establishment as a whole. Aggregates of such figures for an industry reflect not only the primary activities of the establishments in that industry, but also their activities in the manufacture of secondary products and receipts for their other activities (contract work on materials owned by others, repair work, etc.). This fact should be taken into account in comparing industry statistics (tables 1 and 2) with product statistics (table 3) which show the shipments by all producers of the primary products of the industry.

PUBLICATION PROGRAM AND BACKGROUND

More detailed figures for this industry will appear in the final census reports. These reports will also include a comprehensive discussion of such concepts as "industry," "establishments," and "secondary production," as well as the various statistical items such as "employment," and "value added." Similar preliminary and final reports will be issued for other industries during the coming months. Series of preliminary summary reports showing U.S. totals for each manufacturing industry and for each State are being issued. Final industry reports and final area reports will be published during the second half of 1965 through mid-1966. Order forms showing these reports and their prices may be obtained from any U.S. Department of Commerce field office or from the Bureau of the Census, Washington, D.C., 20233.

The 1963 Census of Manufactures is the 27th census of manufacturing establishments in the United States. The first census was conducted in

1810 covering manufacturing activities in 1809. For 1963, it was conducted jointly with censuses of mineral industries, retail trade, wholesale trade, and selected services, under authority of Title 13 of the United States Code. This law requires that a census of manufactures be conducted every 5 years and, as recently amended, to cover years ending in "2" and "7." Thus, the next census will be conducted in 1968 covering manufacturing activity in 1967. Title 13 also authorizes an annual sample survey of manufacturing establishments in interim years.
